

TAPR APRS Special Interest Group Archive, December 1994 through December 1995

December 1994 through December 1995

TAPR's discussion forum for the Automatic Packet Reporting System (APRS), including software, hardware, GPS, mapping, networking, operations, and related technical topics.

This volume contains 12 original monthly files and 5,140 messages, arranged chronologically. The PDF is a readable access copy: MIME transfer encodings are decoded, HTML bodies are converted to plain text, and non-text attachments are represented by descriptive notes. The raw source text is supplied separately with the Internet Archive item.

MacAPRS 1.1.0 is now out.

It has a major new feture. The MAP menu is now HEIRARCHICAL. If you have FOLDERS in you MAPS folder, it will create a HERIRACHICAL menu with that folder name

MacAPRS 1.1.0 is now up on ftp.ucsd.edu in the directory
hamradio/packet/tcpip/incoming.

MacAPRS is also available in PowerPC native version for the PowerMacs. If you have a PowerMac and would like this version, please send me E-Mail and I will get it to you.

APRS for the PC, version 6.2 is also on this same FTP site.

2. Need help with APRS 6.2a and MFJ-1270B

From: Thomas Griffin - x7792 <griff@SSD.intel.com>
Date: Thu, 22 Dec 1994 13:12:09 -0800 (PST)

Rendered body type: text/plain

Let's see if anyone is listening to this mailing list yet...

I have APRS 6.2a for DOS that I am trying to get working with my MFJ-1270B. The TNC was originally a MFJ-1270 that I upgraded to a "B" and has the TAPR 1.1.8 firmware.

When APRS talks to the TNC all I see is garbage from the TNC. If I use Procomm I can talk to the TNC without any problems. In Procomm I am using 9600 baud, no parity, 7 data bits, and 2 stop bits. If I use 8 data bits in Procomm I see the same garbage as I see with APRS. Everything works fine if I use an AEA PK-232MBX TNC.

I used the DOS "mode" command to set the communication parameters before starting APRS, but I still get garbage. Is APRS setting the com port to 8 bits? Perhaps there is something I need to set in the TNC? The dip switches on the TNC can only set the radio and serial port baud rates.

Does anyone know how to contact the APRS author (Bob Brininga, WB4APR) via the Internet? I don't think it would be appropriate to discuss this via

Packet radio since Bob is selling APRS as shareware.

I wanted to give APRS a try while I'm on vacation for two weeks starting 12/24. Does anyone know if there is much APRS activity in the Rochester, NY or Boston, MA areas? I haven't found any APRS activity in Portland, OR.

Any help will be greatly appreciated!

Your problem is the 2 stop bits. All data rates over 110 bit/sec.
use one stop bit. Procomm should be set to no parity, 8 data
bit and 1 stop bit. This is also true for APRS.

Set AWLEN 8, PARITY 0, and cycle power to the TNC.

I don't know why we're still shipping TAPR code with 7/E. At the time, it
was standard for many dialup systems. In that this is 1994, does anyone see
a problem with future releases set for 8/N like all modern TNCs?

It sounds like you have the wrong baud rate for APRS. You might try it
with slower rate I had to go to 1200 for one old MFJ. As far as APRS in
the NW, I see a lot of HF activity but I am not sure what 2 meter freq.
they use up there. We use 145.010 here in N.Cal.

Ok, I am listening. I signed up to this reflector to find out how APRS works. How do I find out? What do I need to make it work? What kind of software is available? How well does it work? What are some of the practical applications that this has been put to? I have an Icom GPS and would like to put it to some more practical uses. I do a lot of exploring in Baja and this might be a good tool. Especially when we have the portable node working on Mt. Diablo at 9,600 feet (not bps).

Marvin.

APRS is a blast. I am currently using APRS v62B for DOS and love it.

You can use it with or without a GPS.

There is also a MAC version available.

I have both on my landline BBS here in Vienna, VA. There are also some
Internet sites that carry it for FTP but I don't know the systems.

If you're interested, 703/207-9622, APRS62B.ZIP. You'll need a 14k4 modem to
get the whole file. I'll post the ALLABOUT.IT file that comes with the
package...

Jack
N4ULS@ram.net

ALLABOUT.it 6.0 AUTOMATIC PACKET REPORTING SYSTEM (APRS)
(by WB4APR)

APRS is the result of my experience over the last 14 years with trying
to use packet radio for real-time communications or public service events.
Packet radio has great potential but so far has been best used for passing
large volumes of message traffic from point to point or into the national
distribution system. It has been difficult to apply packet to real time
events where information has a very short life time. Typically, several
steps are involved in preparing and passing message traffic including
decisions about routing and connectivity.

APRS avoids the complexity and limitations of trying to maintain a
connected network. It permits any number of stations to participate and
exchanges data just like voice users would on a single voice net. Any
station that has information to contribute simply transmits it, and all
stations receive it and log it. Secondly, APRS recognizes that one of the
greatest real-time needs at any special event or emergency is the tracking of
key assets. Where is the Event Leader? Where are the emergency vehicles?
Where's the fire? What's the Weather at various points in the County? Where
are the power lines down? Where is the flood? Where is the head of the
parade? Where are the VIP's? Where is the mobile ATV camera? Where are the
mobiles? Where is the hurricane? WHERE IS THE DX???

Included on the distribution disk are several README text files on
specific applications of APRS such as for weather nets, direction finding,
plotting satellite contacts, and monitoring DX clusters. You must read at
least the HELP.txt, DEMOS.txt, NewNotes.txt and README.1st files. APRS
accomplishes the real-time display of operational traffic via UI frame
broadcasts and map displays. There are three major display subsystems and
a number of other minor displays as follows:

LATEST BEACONS - This display maintains a list of the latest UI frame
received from each station. In effect, this is a multi-station one-line
broadcast message system. Since the lines contain the LATEST time of receipt,
this display shows if a station is still on line within the last few minutes.
In DX cluster mode, it accumulates a list of all users and what was their
latest command to the cluster.

POSITIONS - This display maintains a separate list of the positions of
each station. Each position report can also contain a brief comment. These
lines show the latest time of receiving a given position report and give an
indication of the latency in the network over unreliable paths such as HF.
They also contain Beam Heading for Direction Finding, and Weather conditions
for weather reporting stations. In DX mode, this list also contains the
positions of all DX spots and user-locations heard.

MAPS - Maps to any scale from .5 miles up to 2000 miles can be
displayed. Stations are instantly displayed when they transmit a properly
formatted position beacon. Stations with a reported course and speed are
automatically dead-reckoned to their present position. A complete database

of all the National Weather Service stations is built in. You can center the map anywhere in the world. In DX mode the map defaults to the whole world.

TRAFFIC - In addition to the BEACON text which is used to broadcast information to all other stations on the net, there is an operator-to-operator message capability. Any station can send one line messages to any other station. On receipt, the messages are acknowledged and displayed on the bottom of the receiving stations screen until the operator hits the K key to kill them. These messages are ideal for station-to-station comms while remaining within the APRS environment. However, they are not as effective as the connected protocol, and should not be used routinely for Rag-Chewing on a busy APRS net. To rapidly exchange text, select the COMM option under the OPS menu and use your TNC to connect to the guy.

BULLETINS - This screen is new in version 5.06. It provides the much needed BULLETIN Broadcast capability to keep all stations up to date on happenings and announcements. BULLETINS allow one station to send multiple lines to the BULLETIN page at ALL stations. It is simply a variant of the SEND command noted above, but the send address is BLN# where # is the line number of the BULLETIN line. On receipt, all stations sort the new BLN# lines onto the BULLETIN page so that corrections and replacements are possible.

READ MAIL - This screen shows the last 23 lines of messages exchanged by any stations on the net. Is useful for "READING THE MAIL". DX mode TALK traffic also shows up here.

ALL TRAFFIC LOG - This display is a time sequenced log of every new beacon or one line message sent. Beacons are logged the first time they are received. This is in contrast to the LATEST display which shows the most recent time of receipt of a beacon text. In DX mode, this screen shows a chronological list of all DX/WX/WWV and ANNOUNCEMENTS heard.

HEARD LOG - This display maintains a count of the total number of transmissions from each station per hour. These statistics are ideal for displaying the connectivity of the network over varying paths, such as HF, or to see when stations enter and leave the net.

DIGIPEATER LIST - This display displays the full raw packet header so that APRS users can see what digipeater paths are being used by other stations. The proper use of digipeaters is important in an APRS network. In DX mode, this list accumulates a list of all ACTIVE MESSAGES on the DX cluster.

STATION TRACKING. Although APRS automatically tracks mobile packet stations interfaced to GPS or LORAN navigation, the graphic capability of the maps works perfectly well with manual tracking or with GridSquares. Any station on HF or VHF that includes his GridSquare in brackets as the first text in his beacon text will be plotted by APRS. Additionally, any station can place an object on his map including himself and within seconds that object appears on all other station displays. In the example of a parade, as each checkpoint with packet comes on line, its position is instantly displayed to all in the net. Whenever a station moves, he just updates his position on his map and that movement is transmitted to all other stations. To track other event assets, only one packet operator needs to monitor voice traffic to hear where things are. As he maintains the positions and movements of all assets on his screen, all other displays running APRS software display the same displays. With version 3.04, there is a Tracking command on the P display that will cause APRS to keep the map display always centered on a selected object.

GRID SQUARES: APRS also plots stations by gridsquares. Because of the ambiguity of a grid-square position report, APRS will not display a four digit or six digit gridsquare report on map ranges less than 128 and 8 miles respectively. Stations reported in the same grid square are randomly offset from the center of the grid according to an algorithm based on the letters of their callsigns. This prevents the cluttering of all callsigns on top of each other in the same grid square. The resulting computed POSIT in the POSITION list is annotated to indicate that the position is approximate. Another advantage of GridSquare reporting in APRS is that it allows cautious people to participate in APRS without revealing their exact location. It is also very brief. Six characters vice seventeen. There is a special ALT-G mode to force your outgoing posit to be sent in GRID SQUARE format vice LAT/LONG. Shortening the packet is an advantage when reporting via MIR or SAREX.

USING DUMB TERMINALS IN AN APRS NETWORK: The simplicity and usefulness of this geographic capability cannot be overstressed. Stations running APRS simply move the cursor to where they think they are on the screen and their LAT/LONG coordinates are automatically transmitted to all other stations. Even the simplest of portable packet stations with dumb terminals can report their positions if they can reasonably interpolate their position on a map.

The portable station just looks at the map and enters his LAT/LONG into his beacon text. APRS also plots station positions based on Grid Squares. Eventually, we hope that all stations, no matter how they are using their TNC, will include their LAT/LONG or Grid Square in their Beacon Text so that their location is immediately available. See the PROTOCOL.txt file for details on APRS formats and help in using dumb terminals in an APRS network.

FREQUENCY COORDINATION: APRS makes an excellent mapping tool for frequency coordination. Separate APRS backup files can be maintained for each digital frequency. These files can be distributed via BBS's in the area, and stations can simply load these files into APRS and see where ALL stations are on all frequencies! Not only does this help the frequency coordinating body, but it also is a way to let users see what is where. See FRQCOORD.txt

SPACE APPLICATIONS: APRS could be a solution to the effective use of orbiting terrestrial style packet radio digipeaters in space such as on the Shuttle, MIR, AO-21 and ARSENE. The problem with space digipeaters is the saturation on the uplink channel which makes the use of a normal CONNECTED protocol impractical. For a CONNECTED contact, a total of five successive and successful packet transmissions are required. Not only does APRS reduce this to one packet, but it also capitalizes on the most fascinating aspect of the amateur radio hobby, and that is the display on a map of the location of those stations. If all stations were encouraged to simply insert their LAT/LONG or Grid Square as the first characters of their beacon text, everyone within the satellite footprint would see the location of every successful uplink. Since the shuttle is a rapidly moving object, the locations of successful uplink stations will move progressively along the ground track. All it would take to implement this capability is a single AMSAT news bulletin to ask all stations to insert their POSITS in their beacon text. No changes onboard the shuttle or MIR would be required. See SPACE.txt for further details.

FOX HUNTING OR DIRECTION FINDING: APRS is an excellent tool for plotting the location of a hidden transmitter, balloon, or interfering signal. APRS will display the intersection of bearing lines from a number of reporting stations and also overlapping signal strength contours if only signal strengths are reported. Finally, APRS includes the Fade-Circle Search and Rescue technique which can be used by a mobile with only an OMNI antenna to locate a hidden transmitter.

To use APRS for DFing, each station having a bearing report or a signal strength on the target, simply enters that bearing using the OPS-DF command. His station will then not only report his location, but also a line of bearing or signal strength contour. All stations running APRS can simply hit the X key to display the intersection of these bearing lines. Further, if a DF vehicle has a GPS or LORAN device on board, he can be tracked and directed right to the location of the target. There is an optional Doppler DF registration for direct connection of a Roanoke or Doppler Systems DF unit for automatically plotting and transmitting instantaneous DF bearings. Please note that APRS uses 360 degrees for North and 0 to indicate a signal strength report. For more DF info, see the DF.txt file.

WEATHER STATION REPORTING: APRS position reports can also include the wind speed and direction, as well as other important weather conditions. APRS supports a serial interface option to the ULTIMETER-II home weather station. With this interface, your station includes WX conditions in your position report for display at all other stations in the network. All weather stations show up as a bright blue circle, with a line indicating wind speed and direction. Remember that APRS uses 360 degrees for North and uses 000 to indicate that no wind direction is available. Each of these stations can be highlighted in turn with a single key stroke, so that all WX reports across the state can be had at a glance. See WX.txt for more information. APRS also has a database of the locations of all the NWS sites in the USA for instant display. APRS can also crunch a file of NWS hourly WX conditions and update all NWS stations on the map. NEW in version 6.2, APRS can set Alarms for WX conditions and any WX reports that exceed those values will send an alarm and show up in RED!

DX CLUSTERS: The positional display and real-time user communications makes APRS an ideal tool for the DX cluster user. Not only does he get to see all DX spots on the map, but by operating in the monitor only mode, he has reduced the overall packet load on the DX cluster. This is a benefit to everyone on the channel. Also the APRS monitoring station will see the SPOT as soon as the first station gets it, rather than later on down the list.

PROTOCOL - Since the objective of APRS is the rapid dissemination of real-time information using packet UI frames, a fundamental precept is that old information is less important than new information. All beacons, position reports, messages and display graphics are redundantly transmitted but at a longer and longer repetition rate. Each new beacon is transmitted immediately,

then 20 seconds later. After every transmission, the period is doubled. After ten minutes only six packets have been transmitted. After an hour this results in only 3 more beacons; and only 3 more for the rest of the day! All transmissions can be turned off using one of the CONTROLS commands. But a transmission can be forced at any time by hitting the X key. For details on the APRS raw packet formats see the PROTOCOL.txt file. The maximum period can be set so that packets are repeated no less often than some maximum period. See CAP.txt.

COMMANDS: In most cases the keyboard is always active. There is a mnemonic relationship between all functions and the appropriate key. For this reason, the PC function keys are avoided. (APRS processing of packets on the air is continuous EXCEPT while waiting for the user response to a prompt. These prompts are surrounded with a blue box). Commands fall in to 3 categories:

SCREENS:

Space Key	- Display map and all station locations
L - Latest beacons	- Displays the latest STATUS BEACON from each station
P - Positions	- Displays a list of all stations reporting positions
A - ALL packet log	- Keeps a chronological log of all beacons and messages
B - BULLETINS	- Keeps a list of all BULLETINS heard
R - Read Mail	- Displays the last 23 lines of messages between stns
D - Digis Used	- Displays the digipeater paths being used by others
H - Heard Log	- Displays packets per hour per station for 24 hours
V - VIEW	- Displays all packets on a scrolling screen

SUB-MENUS:

F1- Help	- Select from a MENU of HELP commands
C - Controls	- Display a one line status of all control states
F - FILES Menu	- For Loading/Saving files, or Replaying tracks
I - Input commands	- Used to input posits, DF info or add OBJECTs to map
O - OPERATIONS	- Several commands for normal operations
M - MAP Functions	- Functions dealing with maps
W - Weather Menu	- Displays the number of beacons per hour per station

TRAFFIC:

T - Traffic	- Displays your incoming and outgoing traffic
S - Send	- Sends traffic to a station
E - Erase	- Erases outgoing traffic lines
K - Kill	- Kills incoming traffic lines

DEMONSTRATION FILE: To see how the APRS system works on our frequency, use FILES-LOAD to load the file called FREQ579.BK. This file contains all the local stations on 145.79 MHz in our area. To see the tracking of the GPS equipped Army/Navy game football run, load the file named FBALL.BK and replay the file named FBALL.HST and select to see only FBALL, or CHASE1. To see the Marine Corps marathon event, load MARATHON.BK and replay the MARATHON.HST file. See Details in README.1st.

HOOKING STATIONS: The yellow circular cursor can be moved to select any station in the system using the arrow keys. On the MAP display move the cursor near any station symbol. Then hit the RETURN key to "hook" the station. Detail information on that station will be displayed at the bottom of the screen. Alternatively, use the + and - keys to step through each station one by one. You may also use the cursor on the P or L-list to hook a station or object. Once hooked, several functions may be performed:

1. ALL BEACONS - hitting the A key will list all beacons from that station currently in memory.
2. MOVE - performed by moving the cursor to the desired new location and pressing the Insert key. You are then prompted to enter in a new course, speed, comments or time as needed.
3. DELETE - performed by hitting the D key. Removes the station from the position file.
4. UPLINK - transmit the object to all other stations on the net
5. QUIT - quit uplinking the object to the net.
6. KILL - kill the object from all displays in the network
7. ALARM - you can set an alarm on a station which will alert you if that

station ever moves its position.

8. TRACK - will cause APRS to always center display on selected station

9. #MARK - By marking a station with the # symbol, only that station will be shown when # is used instead of SPACE BAR for drawing a map. If the * key is pressed, all symbols will be shown on the map, but only the marked symbols (#) will show callsigns.

The hook function also works on the LATEST and POSITION display lists by using the up/down arrow keys. If a position exists, hitting the SHOW key will display the map screen with that station centered on the display. This is useful for finding a station which is far off the currently displayed map range. If a position does not exist, you are given the opportunity to create one.

REPLAY: Since all beacons and position reports are retained, the positions of any moving station can be replayed either from memory or from a file. Tracks are kept in on-line memory until 150 have been saved, and then are saved to a HISTORY file. During REPLAY, use the C command to toggle on and off the display of callsigns, and use the HOME and page keys to center and zoom the map display if the mobile station moves off the screen. During replay, use these single key commands:

- C - CALLsigns on/off
- HOME - Homes map to presently displayed station
- SPACE- Redraws the present map to remove track clutter
- F - Faster. Speeds up playback
- G - Overlays the Civil Air Patrol Search and Rescue grids
- P - Pause
- S - Slow. Slows down playback
- Q - Quit playback.
- PgUp/PgDn - Zoom in and out

FILES: All APRS files are retained in four different sub-directories of BAKS, LOGS, HSTS, and README. There are several other files used by the system:

- MAPLIST .map - Contains a list of all map files to be used and also the default LAT/LONG, Range and GMT offset for your location
- BACKUP .BK - Automatic backup of system every time program is quit. This file is overwritten every time the program is quit. It can be reloaded by simply indicating the letter B for a filename.
- RESTORE.TNC - A list of the TNC commands used to restore your TNC after quitting APRS.
- NWSDATA.DAT - A sample file used to load National Weather Service data
- NWSPOSNS.DAT - A file of the locations of all NWS sites
- CAPGRIDS.DAT - A file of the Civil Air Patrol Sectional Aeronautical charts
- DXCALLS.DAT - Callsign prefix-to-LAT/LONG database for DX spots
- MAPFIX.BAS - A very comprehensive Qbasic program that can be used to fix, draw, and modify APRS maps!

CHESSBOARD: To demonstrate the flexibility of APRS in reporting the movement of objects on screens in a net, I have drawn a chessboard map in the center of the Gulf of Mexico. Any two stations can play chess easily using APRS by placing pieces on the map using the INPUT-ADD command and updating their positions using the cursor and INSert keys! The full 32 pieces are already loaded and saved in CHESS.BK. To move a piece, first enable it for uplinking using the U key on the P-list. Then move the cursor and hit the INSert key. Once the other station sees your move, and makes his next move, it is a good idea to Quit the uplinking of that piece using the Q key on the P-list to minimize channel traffic. Monitoring stations that have also zoomed into the chessboard will see the game progress too!

Rendered body type: text/plain

Hi Keith,

Now that you have a PowerPC version I was wondering if it is possible to port to the OS/2 platform. I have been running OS/2 on a 486 for over a year and would LOVE to have APRS in native OS/2.

Thanks for starting this SIG.

Happy Holiday's to all!

11. APRS/TNC Compatability

>
> Art.Jeyes -- AA3GU
> Art.Jeyes@jhuapl.edu

APRS does not use KISS. It uses the "normal" converse/terminal (or whatever it is called) mode. The program lets you select AEA, KAM and TAPR TNCs. I've used it with an AEA PK-232MBX and a MFJ-1270B (TAPR). For the MFJ I had to give the TNC the AWLEN 8 and PARITY 0 commands with a terminal program then power cycled the TNC before running APRS.

Message-ID: <efb63c70@ccgate.berlex.com>
Rendered body type: text/plain

For a Kam, the specific commands necessary (at least for MacAPRS) are:

MCOM OFF
MRESP OFF

HEADERLN OFF
MSTAMP OFF

To Whom it May Concern:

I am running the installation figured below. I am trying to gateway the HF & VHF stations with APRS system. Can anyone tell me what hardware/software is necessary to complete this task? All my other Ham Radio Interfaces can be dual & triple ported except APRS.

Also, does anyone know how to get APRS program to run in windows while minimized like all my other Ham Radio software (NOS, Lan-Link, XPCOM, etc.)?

Please HELP!!!

Thanks,
73, Ron
KE2UK

Hi TAPR Internet folks.

As you may have noticed, your incoming e-mail box has been filled up with a batch of mail from the TAPR info server.

During the Xmas holidays and system hosed up and with our sysop gone out of town it has just now been corrected.

Thanks for the many messages I received letting us know we had a problem.

Shortly we will be moving to our final home and more than one person will have access to the system, which should allow quicker response to these type of problems when Lee is unavailable.

I would like to thank Lee, N5LYT for his terrific support on the system. Without his help to date, the TAPR info server would not be as well managed as it is currently.

Happy New Years everyone.

Greg

I can't help you with HF but I have the same problem running APRS in a background session under OS/2. APRS is the only program I have that will not run in the background and I have not been able to solve the problem even after posting to all the boards and services I can think of. Bob uses screen modes 8 and 9 I think. I have a feeling it all has something to do with updating the screen.

Thought I'd just let you know someone else was having a similar problem.

 Rendered body type: text/plain

I hv downloaded the Mac version frm ucsd.edu TNX, Keith and Mark.
 I am unable to get it to place icons or anything on a map automatically.
 I can do it manually via the EDIT/ADD/STATION item, but nothing appears
 after rcpt of data that shows up in the text box at the bottom of the
 window from a station.
 Anyone have any ideas?
 I run a Max IIvx 5 Mb RAM, I've killed all DA's control panels, etc
 except for CD ROM stuff I think might be needed to use the callbook
 lookup feature which does work. Santa back ordere4d an additional 4 Meg of
 RAM, so tt will help, I think. But doubt if tt is reason for no display
 of even a dot icon on maps.
 TNX
 It is also an unregistered version! I'll be happy to send in the shareware
 fee if I am assured I can get it running.
 TNX again for the programming work!

I am not a Mac user but it sounds like you may not be receiving APRS
 packets. You might check and make sure you are on an APRS frequency - we

use 145.79.

22. Mac/PK-232 Problem solved

From: "John W. (Bill) Hays, W00MV" <billh@INS.INFONET.NET>
Date: Sat, 31 Dec 1994 02:20:06 CST
To: aprssig@tapr.org
Message-ID: <00989BDD.7E09BE66.53@INS.INFONET.NET>
Rendered body type: text/plain

ItDs too bad the commercial software developers donOt provide the level of support that Keith, wu2z, provides both via the INTERNET and then about fifteen minutes after I posted a problem on this SIG he calls me on the phone from his home. I have never had such fantastic support! All for a measley 30 buck shareware fee.

At any rate my problem is solved. The MacAPRS version runs FB after I made one change.

For users of the AEA PK-232(perhaps other AEA products, too) in addition to setting HEADERLINE to OFF and MON = 4, set MSTAMP = OFF. Then set the TNC out of HOST mode. Then start MacAPRS.

With MSTAMP ON it interfered with the decoding of incoming data. I was getting the data OK from the TNC, but it would not display anything on any map.

TNX again Keith!
73,
Bill

MacAPRS 1.2.0 is now up at ftp.ucsd.edu

Currently it is in /hamradio/packet/tcpip/incoming.
However it may get moved to /hamradio/packet/aprs.

In the future, you need to check both places for the most recent version. The INCOMING directory is where I am allowed to put it, then eventually, it will get moved to the APRS directory..

New Features...

Statistics Window
=====

Has 'activity' charts. One for the last 24 hours, and on for the last week. These are BAR GRAPHS of packets-per-time. The 24-hour one shows how many packets for every 5-minute segment for the last 24 hours. The 1-week chart shows how many packets for every 1-hour segment for the last week. You can click on the graph to find out the exact value for any specific time slot. Or hold down the option key and click to get an overall value. Nice interface too.

There is a list of buffer sizes, used and maximums too. This is a good place to find out how many maps are loaded, how many active stations, how many ALLOWED stations, how big the packet buffers are etc..

Weather Chart Window & Weather Display Window
=====

If you have the Peet Bros Weather Station, there is significant amounts of weather history data that can now be viewed. The charts are exactly like the bar-charts described above..

If anybody has the Peet Bros Weather Station, please send me E-Mail..

Automatic Logging =====

The ability to AUTOMATICALLY start the logging.

In the MacAPRS Settings dialog box are 4 new check boxes.

[] STATION Logging
[] APRS Logging
[] NMEA Logging
[] Weather Logging

If checked, the logging will start automatically on startup of the program

Note. The STATION logging is relatively new. It writes the following information out to the file named STATIONS.LOG in the LOG folder.

Startup time and version of program.
Call sign and date of every station seen.

A couple of minor bug-fixes.

I'm not very clear about just how and when and under what radio/TNC configuration the various "RELAY", "GATE" and "WIDE" commands or strings are to be used in the "UNPROTO" statement.
Could someone elaborate on that for me.
I.e. If I want the rest of the world (No ego here Hi Hi) to know where I am and I have only VHF what do I use? etc.
Then if I have a VHF and an HF radio what...? etc.

>73

If you have the DOS version, check the file DIGIS.TXT for a good explanation of how the protocol uses the wildcard digipeater aliases. If you have the Mac version there should be a similar description somewhere.

In a nutshell, the wildcard alias WIDE is reserved for wide area digipeaters that are positioned to pick up mobile position packets and relay them to other WIDES. The alias GATE is reserved for HF gateways that run on dual-port TNC's and allows position packets to be bridged from HF to VHF. The alias RELAY is good to use in your UNPROTO if you are mobile and too far from a WIDE to be heard but close enough to a home station that is configured with an alias of RELAY so your packet can get to a WIDE by going through the RELAY.

You should use care in specifying your unproto path. For example, WIDE,RELAY would create a mess as any RELAYS that can hear the WIDE you go through will repeat the packet at the same time causing massive collisions. WIDE,WIDE,WIDE should be avoided too. If you are close to a WIDE, you can try WIDE,WIDE at first, then specify actual callsigns once you get a feel for what is available on the frequency in your area. For example, you can start with WIDE,WIDE then switch to CALLSIGN,WIDE or CALLSIGN,CALLSIGN,WIDE, etc.

To: aprssig@tapr.org
Message-ID: <9501051812.AA0476@mgos2.ampr.org>
Rendered body type: text/plain

Anyone know how I can get APRS talking to a KISS mode TNC or a BPQ node? I want to get APRS talking to JNOS via a null modem cable. JNOS can only talk to a KISS mode TNC or perhaps a BPQ switch. APRS seems like it can only talk to a TNC in command mode. Any info would be appreciated.

I've heard rumors about one or two Windows Based APRS programs. Are these programs available for testing? I'm looking to get APRS running on an OS/2 Machine and have it talk to JNOS on the same machine. In this application... it would be nice if APRS was windows based. Thanks.

In order to get up to speed quickly, I'd like to obtain printed information on what APRS is.

I'm a retired physicist, a life-long sailor, and a QCWA-old, extra class ham, so I should understand what's going on. Yet, everything I've read on the subject in current ham literature seems exceptionally trivial. Can somebody point me in the right direction?

There is a MACINTOSH version of APRS called MacAPRS (I wrote it)..
Someone asked a question about porting it to OS/2 here, but there was no
mention of anything being done.

The PC version is written in Quick-Basic...My Macintosh version is written in 'C'.

APRS only talks to NORMAL TNCs (TAPR-2 based) that have a MONITOR mode. In
KISS mode you do not get the data in the same formats and therefore it
doesn't work..
It might be able to be made to work, but that would had another level of
complexity to the parsing of the data...

> Keith Sproul

Your right... it would add complexity but it would also add
flexibility. Currently my JNOS Box has 4 radios/tncs attached to it. It's
running in an OS/2 Dox box. One of the radios gives me a 9600b link to an
Internet Gateway. If I could have JNOS talk to the APRS program via KISS
and a NULL Modem cable, besides feeding data heard from the 4 radio ports
to aprs I could also feed it info taken from other APRS systems connected

via the gateway. I could let my TCP/IP system run, and then switch over to a OS/2 DOS Box running APRS (or a windows version) and see who's active locally... zoom out and see who's active in Texas... zoom further out...etc. Limiting me (and everyone else) to a dedicated TNC and radio would put a damper on my idea.

When APRS received WX data... how is it displayed? I've been playing with a temperature IC that lets me determine the outdoor temp using my PC. I can broadcast this info in a UI frame using JNOS. If an APRS box receives this info (assuming that it's formatted correctly.) how will it be displayed?

Also... if I just have the Temp. data... do I have to specify 000 for wind speed and direction?

Thanks.

I will get you the exact format so that you can do this..

It would include your lat/lon, station type of Weather which is the underscore charcter, and then the weather data, yes, unknown data would be put in as zeros..

I see no reason to flame you.. Your comments are at least somewhat accurate.. I have known people that were able to get the PC version up and running with very little trouble without reading much documentation and people that had to struggle with it..

The Mac version is somewhat easier to get up and running, but it too has some things that are not as clear as they should be....

There are MANY different aspects to APRS, and some of them are fairly well written up in Bob's (WB4APR) documentation and some of them are not. I too have a problem of incomplete documentation and have been working on this problem.

Both Bob and I keep getting requests for MORE AND MORE features, and have not had as much time to get back to writing the documentation as we would like. A lot of Bob's documentation as simply 'evolved' over time...

You really have to try it to see what it's all about. It helps if there is established APRS activity in your area already. The first time I used it there was little activity and active digipeaters. That was almost two years ago, and I put it away after a few days of experimentation.

About a month ago I downloaded the latest version and fired it up again. Now I see stations all up and down the east coast (I'm in the DC area) that come in on 2m alone. There is a network of digipeaters that allow me to see position reports from as far north as New York City. It is a neat system and it has a lot of applications in some of the public service activities hams participate in, such as marathons, weather spotting, etc.

Part of its beauty is its simplicity. This may make it seem trivial at first, but after you see what it can do you might feel different about it.

ALLABOUT.it 6.0 AUTOMATIC PACKET REPORTING SYSTEM (APRS)

APRS is the result of my experience over the last 14 years with trying to use packet radio for real-time communications or public service events. Packet radio has great potential but so far has been best used for passing large volumes of message traffic from point to point or into the national distribution system. It has been difficult to apply packet to real time events where information has a very short life time. Typically, several steps are involved in preparing and passing message traffic including decisions about routing and connectivity.

APRS avoids the complexity and limitations of trying to maintain a connected network. It permits any number of stations to participate and exchanges data just like voice users would on a single voice net. Any station that has information to contribute simply transmits it, and all stations receive it and log it. Secondly, APRS recognizes that one of the greatest real-time needs at any special event or emergency is the tracking of key assets. Where is the Event Leader? Where are the emergency vehicles? Where's the fire? What's the Weather at various points in the County? Where are the power lines down? Where is the flood? Where is the head of the parade? Where are the VIP's? Where is the mobile ATV camera? Where are the mobiles? Where is the hurricane? WHERE IS THE DX???

Included on the distribution disk are several README text files on specific applications of APRS such as for weather nets, direction finding,

plotting satellite contacts, and monitoring DX clusters. You must read at least the HELP.txt, DEMOS.txt, NewNotes.txt and README.1st files. APRS accomplishes the real-time display of operational traffic via UI frame broadcasts and map displays. There are three major display subsystems and a number of other minor displays as follows:

LATEST BEACONS - This display maintains a list of the latest UI frame received from each station. In effect, this is a multi-station one-line broadcast message system. Since the lines contain the LATEST time of receipt, this display shows if a station is still on line within the last few minutes. In DX cluster mode, it accumulates a list of all users and what was their latest command to the cluster.

POSITIONS - This display maintains a separate list of the positions of each station. Each position report can also contain a brief comment. These lines show the latest time of receiving a given position report and give an indication of the latency in the network over unreliable paths such as HF. They also contain Beam Heading for Direction Finding, and Weather conditions for weather reporting stations. In DX mode, this list also contains the posits of all DX spots and user-locations heard.

MAPS - Maps to any scale from .5 miles up to 2000 miles can be displayed. Stations are instantly displayed when they transmit a properly formatted position beacon. Stations with a reported course and speed are automatically dead-reckoned to their present position. A complete database of all the National Weather Service stations is built in. You can center the map anywhere in the world. In DX mode the map defaults to the whole world.

TRAFFIC - In addition to the BEACON text which is used to broadcast information to all other stations on the net, there is an operator-to-operator message capability. Any station can send one line messages to any other station. On receipt, the messages are acknowledged and displayed on the bottom of the receiving stations screen until the operator hits the K key to kill them. These messages are ideal for station-to-station comms while remaining within the APRS environment. However, they are not as effecient as the connected protocol, and should not be used routinely for Rag-Chewing on a busy APRS net. To rapidly exchange text, select the COMM option under the OPS menu and use your TNC to connect to the guy.

BULLETINS - This screen is new in version 5.06. It provides the much needed BULLETIN Broadcast capability to keep all stations up to date on happenings and announcements. BULLETINS allow one station to send multiple lines to the BULLETIN page at ALL stations. It is simply a variant of the SEND command noted above, but the send address is BLN# where # is the line number of the BULLETIN line. On receipt, all stations sort the new BLN# lines onto the BULLETIN page so that corrections are replacements are possible.

READ MAIL - This screen shows the last 23 lines of messages exchanged by any stations on the net. Is useful for "READING THE MAIL". DX mode TALK traffic also shows up here.

ALL TRAFFIC LOG - This display is a time sequenced log of every new beacon or one line message sent. Beacons are logged the first time they are received. This is in contrast to the LATEST display which shows the most recent time of receipt of a beacon text. In DX mode, this screen shows a chronological list of all DX/WX/WWV and ANNOUNCEMENTS heard.

HEARD LOG - This display maintains a count of the total number of transmissions from each station per hour. These statistics are ideal for displaying the connectivity of the network over varying paths, such as HF, or to see when stations enter and leave the net.

DIGIPEATER LIST - This display displays the full raw packet header so that APRS users can see what digipeater paths are being used by other stations. The proper use of digipeaters is important in an APRS network. In DX mode, this list accumulates a list of all ACTIVE MESSAGES on the DX cluster.

STATION TRACKING. Although APRS automatically tracks mobile packet stations interfaced to GPS or LORAN navigation, the graphic capability of the maps works perfectly well with manual tracking or with GridSquares. Any station on HF or VHF that includes his GridSquare in brackets as the first text in his beacon text will be plotted by APRS. Additionally, any station can place an object on his map including himself and within seconds that object appears on all other station displays. In the example of a parade, as each checkpoint with packet comes on line, its position is instantly displayed to all in the net. Whenever a station moves, he just updates his position on his map and that

movement is transmitted to all other stations. To track other event assets, only one packet operator needs to monitor voice traffic to hear where things are. As he maintains the positions and movements of all assets on his screen, all other displays running APRS software display the same displays. With version 3.04, there is a Tracking command on the P display that will cause APRS to keep the map display always centered on a selected object.

GRID SQUARES: APRS also plots stations by gridsquares. Because of the ambiguity of a grid-square position report, APRS will not display a four digit or six digit gridsquare report on map ranges less than 128 and 8 miles respectively. Stations reported in the same grid square are randomly offset from the center of the grid according to an algorithm based on the letters of their call signs. This prevents the cluttering of all call signs on top of each other in the same grid square. The resulting computed POSIT in the POSITION list is annotated to indicate that the position is approximate. Another advantage of GridSquare reporting in APRS is that it allows cautious people to participate in APRS without revealing their exact location. It is also very brief. Six characters vice seventeen. There is a special ALT-G mode to force your outgoing posit to be sent in GRID SQUARE format vice LAT/LONG. Shortening the packet is an advantage when reporting via MIR or SAREX.

USING DUMB TERMINALS IN AN APRS NETWORK: The simplicity and usefulness of this geographic capability cannot be over stressed. Stations running APRS simply move the cursor to where they think they are on the screen and their LAT/LONG coordinates are automatically transmitted to all other stations. Even the simplest of portable packet stations with dumb terminals can report their positions if they can reasonably interpolate their position on a map. The portable station just looks at the map and enters his LAT/LONG into his beacon text. APRS also plots station positions based on Grid Squares. Eventually, we hope that all stations, no matter how they are using their TNC, will include their LAT/LONG or Grid Square in their Beacon Text so that their location is immediately available. See the PROTOCOL.txt file for details on APRS formats and help in using dumb terminals in an APRS network.

FREQUENCY COORDINATION: APRS makes an excellent mapping tool for frequency coordination. Separate APRS backup files can be maintained for each digital frequency. These files can be distributed via BBS's in the area, and stations can simply load these files into APRS and see where ALL stations are on all frequencies! Not only does this help the frequency coordinating body, but it also is a way to let users see what is where. See FRQCOORD.txt

SPACE APPLICATIONS: APRS could be a solution to the effective use of orbiting terrestrial style packet radio digipeaters in space such as on the Shuttle, MIR, AO-21 and ARSENE. The problem with space digipeaters is the saturation on the uplink channel which makes the use of a normal CONNECTED protocol impractical. For a CONNECTED contact, a total of five successive and successful packet transmissions are required. Not only does APRS reduce this to one packet, but it also capitalizes on the most fascinating aspect of the amateur radio hobby, and that is the display on a map of the location of those stations. If all stations were encouraged to simply insert their LAT/LONG or Grid Square as the first characters of their beacon text, everyone within the satellite footprint would see the location of every successful uplink. Since the shuttle is a rapidly moving object, the locations of successful uplink stations will move progressively along the ground track. All it would take to implement this capability is a single AMSAT news bulletin to ask all stations to insert their POSITS in their beacon text. No changes onboard the shuttle or MIR would be required. See SPACE.txt for further details.

FOX HUNTING OR DIRECTION FINDING: APRS is an excellent tool for plotting the location of a hidden transmitter, balloon, or interfering signal. APRS will display the intersection of bearing lines from a number of reporting stations and also overlapping signal strength contours if only signal strengths are reported. Finally, APRS includes the Fade-Circle Search and Rescue technique which can be used by a mobile with only an OMNI antenna to locate a hidden transmitter.

To use APRS for DFing, each station having a bearing report or a signal strength on the target, simply enters that bearing using the OPS-DF command. His station will then not only report his location, but also a line of bearing or signal strength contour. All stations running APRS can simply hit the X key to display the intersection of these bearing lines. Further, if a DF vehicle has a GPS or LORAN device on board, he can be tracked and directed right to the location of the target. There is an optional Doppler DF registration for direct connection of a Roanoke or Doppler Systems DF unit for automatically plotting and transmitting instantaneous DF bearings. Please note that APRS uses 360 degrees for North and 0 to indicate a signal strength report. For more DF info, see the DF.txt file.

WEATHER STATION REPORTING: APRS position reports can also include the wind speed and direction, as well as other important weather conditions. APRS supports a serial interface option to the ULTIMETER-II home weather station. With this interface, your station includes WX conditions in your position report for display at all other stations in the network. All weather stations show up as a bright blue circle, with a line indicating wind speed and direction. Remember that APRS uses 360 degrees for North and uses 000 to indicate that no wind direction is available. Each of these stations can be highlighted in turn with a single key stroke, so that all WX reports across the state can be had at a glance. See WX.txt for more information. APRS also has a database of the locations of all the NWS sites in the USA for instant display. APRS can also crunch a file of NWS hourly WX conditions and update all NWS stations on the map. NEW in version 6.2, APRS can set Alarms for WX conditions and any WX reports that exceed those values will send an alarm and show up in RED!

DX CLUSTERS: The positional display and real-time user communications makes APRS an ideal tool for the DX cluster user. Not only does he get to see all DX spots on the map, but by operating in the monitor only mode, he has reduced the overall packet load on the DX cluster. This is a benefit to everyone on the channel. Also the APRS monitoring station will see the SPOT as soon as the first station gets it, rather than later on down the list.

PROTOCOL - Since the objective of APRS is the rapid dissemination of real-time information using packet UI frames, a fundamental precept is that old information is less important than new information. All beacons, position reports, messages and display graphics are redundantly transmitted but at a longer and longer repetition rate. Each new beacon is transmitted immediately, then 20 seconds later. After every transmission, the period is doubled.

After

ten minutes only six packets have been transmitted. After an hour this results

in only 3 more beacons; and only 3 more for the rest of the day! All transmissions can be turned off using one of the CONTROLS commands. But a transmis-

sion can be forced at any time by hitting the X key. For details on the APRS raw packet

formats see the PROTOCOL.txt file. The maximum period can be set so that packets are repeated no less often than some maximum period. See CAP.txt.

COMMANDS: In most cases the keyboard is always active. There is a mnemonic relationship between all functions and the appropriate key. For this reason, the PC function keys are avoided. (APRS processing of packets on the air is continuous EXCEPT while waiting for the user response to a prompt. These prompts are surrounded with a blue box). Commands fall in to 3 categories:

SCREENS:

Space Key	- Display map and all station locations
L - Latest beacons	- Displays the latest STATUS BEACON from each station
P - Positions	- Displays a list of all stations reporting positions
A - ALL packet log	- Keeps a chronological log of all beacons and messages
B - BULLETINS	- Keeps a list of all BULLETINS heard
R - Read Mail	- Displays the last 23 lines of messages between stns
D - Digis Used	- Displays the digipeater paths being used by others
H - Heard Log	- Displays packets per hour per station for 24 hours
V - VIEW	- Displays all packets on a scrolling screen

SUB-MENUS:

F1- Help	- Select from a MENU of HELP commands
C - Controls	- Display a one line status of all control states
F - FILES Menu	- For Loading/Saving files, or Replaying tracks
I - Input commands	- Used to input posits, DF info or add OBJECTS to map
O - OPERATIONS	- Several commands for normal operations
M - MAP Functions	- Functions dealing with maps
W - Weather Menu	- Displays the number of beacons per hour per station

TRAFFIC:

T - Traffic	- Displays your incoming and outgoing traffic
S - Send	- Sends traffic to a station
E - Erase	- Erases outgoing traffic lines
K - Kill	- Kills incoming traffic lines

DEMONSTRATION FILE: To see how the APRS system works on our frequency, use FILES-LOAD to load the file called FREQ579.BK. This file contains all the

local stations on 145.79 MHz in our area. To see the tracking of the GPS equipped Army/Navy game football run, load the file named FBALL.BK and replay the file named FBALL.HST and select to see only FBALL, or CHASE1. To see the Marine Corps marathon event, load MARATHON.BK and replay the MARATHON.HST file. See Details in README.1st.

HOOKING STATIONS: The yellow circular cursor can be moved to select any station in the system using the arrow keys. On the MAP display move the cursor near any station symbol. Then hit the RETURN key to "hook" the station. Detail information on that station will be displayed at the bottom of the screen. Alternatively, use the + and - keys to step through each station one by one. You may also use the cursor on the P or L-list to hook a station or object. Once hooked, several functions may be performed:

1. ALL BEACONS - hitting the A key will list all beacons from that station currently in memory.
2. MOVE - performed by moving the cursor to the desired new location and pressing the Insert key. You are then prompted to enter in a new course, speed, comments or time as needed.
3. DELETE - performed by hitting the D key. Removes the station from the position file.
4. UPLINK - transmit the object to all other stations on the net
5. QUIT - quit uplinking the object to the net.
6. KILL - kill the object from all displays in the network
7. ALARM - you can set an alarm on a station which will alert you if that station ever moves its position.
8. TRACK - will cause APRS to always center display on selected station
9. #MARK - By marking a station with the # symbol, only that station will be shown when # is used instead of SPACE BAR for drawing a map. If the * key is pressed, all symbols will be shown on the map, but only the marked symbols (#) will show callsigns.

The hook function also works on the LATEST and POSITION display lists by using the up/down arrow keys. If a position exists, hitting the SHOW key will display the map screen with that station centered on the display. This is useful for finding a station which is far off the currently displayed map range. If a position does not exist, you are given the opportunity to create one.

REPLAY: Since all beacons and position reports are retained, the positions of any moving station can be replayed either from memory or from a file. Tracks are kept in on-line memory until 150 have been saved, and then are saved to a HISTORY file. During REPLAY, use the C command to toggle on and off the display of callsigns, and use the HOME and page keys to center and zoom the map display if the mobile station moves off the screen. During replay, use these single key commands:

- C - CALLsigns on/off
- HOME - Homes map to presently displayed station
- SPACE- Redraws the present map to remove track clutter
- F - Faster. Speeds up playback
- G - Overlays the Civil Air Patrol Search and Rescue grids
- P - Pause
- S - Slow. Slows down playback
- Q - Quit playback.
- PgUp/PgDn - Zoom in and out

FILES: All APRS files are retained in four different sub-directories of BAKS, LOGS, HSTS, and README. There are several other files used by the system:

- MAPLIST .map - Contains a list of all map files to be used and also the default LAT/LONG, Range and GMT offset for your location
- BACKUP .BK - Automatic backup of system every time program is quit. This file is overwritten every time the program is quit. It can be reloaded by simply indicating the letter B for a filename.
- RESTORE.TNC - A list of the TNC commands used to restore your TNC after quitting APRS.
- NWSDATA.DAT - A sample file used to load National Weather Service data

NWSPOSNS.DAT - A file of the locations of all NWS sites
CAPGRIDS.DAT - A file of the Civil Air Patrol Sectional Aeronautical charts
DXCALLS.DAT - Callsign prefix-to-LAT/LONG database for DX spots
MAPFIX.BAS - A very comprehensive Qbasic program that can be used to fix,
draw, and modify APRS maps!

CHESSBOARD: To demonstrate the flexibility of APRS in reporting the movement of objects on screens in a net, I have drawn a chessboard map in the center of the Gulf of Mexico. Any two stations can play chess easily using APRS by placing pieces on the map using the INPUT-ADD command and updating their positions using the cursor and INSert keys! The full 32 pieces are already loaded and saved in CHESS.BK. To move a piece, first enable it for uplinking using the U key on the P-list. Then move the cursor and hit the INSert key. Once the other station sees your move, and makes his next move, it is a good idea to Quit the uplinking of that piece using the Q key on the P-list to minimize channel traffic. Monitoring stations that have also zoomed into the chessboard will see the game progress too!

20. Re: [APRSSIG:31] Query on documentation

From: janderson@ram.net
Date: Thu, 05 Jan 95 15:33:22 EST
To: aprssig@tapr.org
Message-ID: <02049.15021591@RAMail>
Rendered body type: text/plain

SUMMARY: APRS can be summed up with two concepts, REAL-TIME PACKET TACTICAL COMMUNICATIONS and MAPS. Probably 98 % of APRS potential does not need GPS or any tracking devices. Think of APRS as just a multi-user distributed packet network with a MAP display for many exciting amateur applications:

Network topology monitoring	Direction Finding
weather reporting	DX cluster monitoring
AMSAT ground station tracker	Satellite tracker (future)
boat/mobile/RV tracker	Special event tracker/organizer
Local area CHAT mode	HF DX plotter
RF path estimating	Search and Rescue
Frequency Coordination database	

To support the obvious Automatic Vehicle Location application it is important that all mobile operations should be on the single 145.79, 445.925, and 10.1515 LSB national vehicle tracking frequencies. Mobile's wander across political boundaries and single frequency XTAL controlled GPS trackers are common. See UHFFREQ.txt

Aside from these standard APRS frequencies for vehicle tracking and SKYwarn applications, there is no reason why APRS cannot be used as a monitoring tool on any frequency. If all NODES, BBS's, DIGI's and other full time packet stations simply included their position in their beacons, then any APRS user could see a network map of all assets on any frequency. This is an excellent Frequency Coordination tool! Each night when you secure, leave your APRS system on a different digital frequency and see who you pick up!

DEMONSTRATIONS: To get familiar with APRS, there are two important commands for seeing past events. First, you can load from a selection of BACKUP files a snapshot of previous events. These files are loaded using the FILES-LOAD command and reload all the APRS pages at the time the file was saved. Nothing moves, but you can see all the APRS screens that show the position, status, and latest packet from each station. The more powerful demonstration tool of APRS is the FILE-REPLAY feature which lets you replay the track history file of a previous event. All position reports are replayed to see station movements on the map. Many major APRS events are included on the distro disk. You should replay them all and use the PgUP/DN keys and HOME key to zoom in or out as the file is replayed.

DOCUMENTATION: Since APRS is a generalized packet tool with application in almost all facets of amateur radio, it is hard to write a simple description. For this reason all of the documentation so far is separated into numerous .TXT files, each focused on a particular subject. These files can be read ON-LINE using the F1(HELP)-FILES command. All of these files are in the README subdirectory:

FILENAME	DESCRIPTION
-----	-----
README.1st	This file
README.now	Tells you how to unzip the APRS distribution disk
NEWNOTES.txt	Tells of important changes in the latest versions
ALLABOUT.IT	General description and overview of APRS

AIRCRAFT.txt Using APRS from Aircraft and how to interface to ARNAV format
 BBSNOTES.txt Suggestions to BBS SYSOPS on how to use APRS
 CDROM.txt Using MAPFIX.bas to generate maps from \$32 USGS CD ROMs
 COMMERCL.txt COMMERCIAL APRS to interface with other DELORME/STREETS prgms
 DF.txt Information on DFing and AUTOMATIC Doppler interfaces!
 DEMOS.txt A quick summary of demonstrations and replays to impress you.
 DIGIS.txt Important info on using Digipeaters
 DIGITIZR.txt Using DIGITIZERS to draw your own maps with MAPFIX.bas prgm!
 PROTOCOL.txt Info on APRS formats for setting up TNC BTexts
 DX.txt Info on using APRS to plot DX spots on a DX cluster frequency
 GPS.txt Interfacing GPS or LORAN to APRS or stand-alone TNC's
 HF.txt Notes on the APRS HF tracking network
 HELP.txt Describes each of the APRS commands in detail
 MAPS.txt Detailed information on how to build your own maps
 MARATHON.txt Lessons learned at the Marine Corps Marathon
 MOBILE.txt Notes on Mobile operations with GPS
 OPS.txt Suggestions on routine APRS operations
 SCREEN.txt Describes the APRS screen and display areas
 SPACE.txt Suggested use of APRS for plotting satellite packet stations
 SYMBOLS.txt A table of APRS symbols and the symbol designators
 WX.txt Info on using APRS for displaying weather information
 BOATS.txt Suggested use of APRS to support the WaterWay Net

 IDEAS.txt A file of other neat APRS ideas to encourage others to write
 supporting TNC and forwarding code. Programmers READ IT!

SETUP: You should customize APRS to automatically come up centered on your favorite map screen by zooming the map to your center of activity. Either your home, or a WIDE area APRS digipeater. Next set your desired digipeater path using the UNPROTO command. (To understand the UNPROTO concept, refer to your TNC manual). Finally, use the ALT-SETUP menu to SAVE your config file. You will be prompted for your validation number and then asked for a CONFIG file extension. Normally just select the default of APRS unless you want to be able to invoke several different CONFIG files... Once you have saved a config file, APRS will always come up ready to go on your area.

Once you have zoomed into your neighborhood, non-registered users can use the FILE-SAVE command to SAVE a backup file of their current situation. When they start up APRS, after logging on, they simply use FILE-LOAD to LOAD that backup file to bring up the neighborhood map. Then they move the cursor and place themselves on the map in the right place. Europeans, or non US hams may want to change the default map from the initial USA map, to something closer to home. The initial map is determined by the default LAT/LONG and RANGE given in the first three lines of the MAPLIST.APR file. Without a config file, APRS always starts up at this location and scale. Obviously the locataion in Kansas was chosen so that the whole US came up first. As of version 5.9, you can have many different MAPLIST.xxx files.

MAPS! - To see my best maps so far, zoom into Idaho Falls at 43 30N and 112 02W to the 1 mile range, or either Baltimore or NewOrleans to the 4 mile scale. By now (June 94) there are large area maps for most of the USA that will get you down to the 32 or 64 mile VHF range in your area. You can make your own maps from the directions in MAPS.txt using a variety of different techniques. You can get a \$32 USGS CD rom that covers your area and use it to develop APRS maps all the way down to the street level. See CDROM.txt. In any case, dedication and effort are involved, but having a local street map that can be freely distributed to all the amateur community, is worth it. In some cases, I may be persuaded to do custom maps for anywhere from \$90 to \$195 depending on complexity and my wife's honey-do list. It is really quite simple to draw a map from any source. Just grid the map, define the upper left origin, and enter X-Y points for all features. A map of reasonable detail should only take a few evenings. Fortunately, everyone in your area can use the results of your efforts!

Look for an APRS BBS in your state. Already, Ohio Missouri and Calif have developed dozens of local maps. The biggest APRS states are CA,OH,FL,TX,MD, AZ,VA,NJ,and NewEngland. Thirty states have three or less users. If you are in one of these states, AND DONT HAVE A DECENT MAP OF YOUR AREA. Let me know! There are more APRS maps now than fit on the original APRS distribution disk. See XTRAMAPS.txt.

APRS PROTOCOL: APRS uses Unnumbered Information (UI) frames which are transmitted without ACKS to avoid the problems, complexities and in-efficiencies of a normal fully connected network. To be a good APRS operator, you need to understand DIGIPEATING and the use of the MY ALIAS and UNPROTO commands, since you are responsible for your own best path within the network. If you are unfamiliar with these UI terms, consult your TNC user manual. Although the

APRS documents speak frequently about BEACONS, it is important to note that these are NOT the TNC BText beacons. While APRS is on-line, it suppresses the TNC BText and generates its own Status and Position reporting UI frames.

PACKET POSITIONS ON ALL FREQS: Finally, encourage all BBS's, NODES, Servers, and stations in your area, to place their LAT/LONG in their beacon text using the format: BT !DDMM.xxN/DDMM.xxW/...comments. APRS will accept this fixed station position format anywhere in the ID text. APRS will also plot the positions of stations reporting by Grid Square surrounded by brackets [FM19xy]. If all packet assets get in that habit, then APRS will automatically plot a map of packet activity on any frequency! If stations will also put the new Power/antenna/gain format in their BText, then effective communications ranges can also be displayed! See PROTOCOL.txt for formats.

STAND-ALONE-GPS-TRACKERS: All PACCOM TNC's with version 3.2 firmware include a GPS command that tells the TNC to accept GPS data (NMEA-0183 format) on the serial port and place it in the TNC LOCATION TEXT. Then the TNC will transmit that Position at a rate set by the user! Note that this is a dedicated stand-alone application, and while the TNC is in this mode, it no longer operates as a normal TNC for two-way communications. But, this is the simplest method to build a stand-alone-tracker. If you are running the APRS software mobile on a laptop, then see GPS.txt for ways to use ANY TNC or ANY GPS while still operating on the air with APRS.

MORE READING: For more info on APRS, see page 92 of July and page 11 of the August 1993 QST and the Dec 1993 issue of CQ. Also get the February 1994 issue

of QEX for the article on Interfacing GPS to packet. More coverage was provided in October 94 issue of 73 magazine under the topic of HOMING IN, and a full page of pictures on page 14 of the DEC 94 issue of QST. Look for more in the Jan 95 issue of 73. Also see the front page of the May 1993 issue of the AMSAT journal (but the registration information is incorrect there).

BBS ADDRESS: My BBS address is WB4APR @ WB3V.MD. I cannot respond to tons of traffic, but will try to keep up... Do feel free to send me any comments or suggestions, but avoid any traffic in which I may have a pecuniary interest! Hi Hi! Look for a local APRS point of contact for your state. Some states have dedicated APRS phone line BBS's for distributing local APRS maps. Ohio is up to 50 maps as of Nov 94.

Other phone line BBS's known to carry APRS:

> Thanks.
```

Here's the WX.TXT file from the DOS version that may help some.

73,

Jack
N4ULS@ram.net

New in 6.2b: You can now enter Wind in KPH and temp in Celsius
 New in 6.1: Added user WX alarms (See Alarms below). Finally fixed in 6.2a
 New in 6.0: You can now mark large areas from 100' to 100 miles on your maps and send the area as a symbol. Very useful for WX WARNINGS!

KPH and CELSIUS: I have added the ability to enter and display KPH and degrees Celsius. You enable this by doing a manual WX report entry and answer with EITHER K for KPH or C for Celsius. From then on, the WX display at the top of the screen will display in those units. You can make this permanent, by saving a CONFIG file. The on-air APRS WX protocols, however, still will be in MPH and F. Also, the ALARMS will be compared to MPH and F values.

WX ALARMS: At the suggestion of the NWS in Indianapolis, I have added certain user settable WX alarm settings. When ever a WX report comes in that exceeds the value, the station is plotted in RED and an ALARM is sounded. The alarms are WIND, TEMP, and RAIN. Besides the obvious wind threshold, the max and min temp settings can be used to warn of the passing of a warm or a cold front. These alarms can make an almost un-attended SKYWARN network! Just install an APRS computer at the NWS site, and let the NWS operators set the alarm levels. Then without transmitting a single packet (there is rarely a licensed HAM on the premises) the APRS screen will show all of the SKYWARN data and what sites are reporting alarm conditions!

CLEARING ALARMS: When an alarm condition occurs, the station is drawn in RED and the map is automatically re-drawn to center on that station. Also, the station is marked on the P-list with the ALARM marker. TO clear the alarm, simply hook the station on the map, and then UNhook it (hit the ENTER key twice). To clear the A on the P-list, hook the station and hit the A key. Normally, the ALARM on the P-list will only sound if that station MOVES. Since a WX station should not move, there is really no problem in leaving the A on the Plist until convenient to remove it.

OVERSIGHT in 6.1! Bells going off all the time, due to stations entering manual WX reports that do not exactly match the U-II generated APRS WX format. Also the PHGxxxx or DFSxxxx formats are interpreted as WIND and the ALARM sounds! Its fixed in 6.11. Sorry. xxxxx really fixed in 6.2a!

DISABLING WX ALARMS: In order to not set off alarms, simply set your thresholds higher than any values expected. The defaults are 100 for the high temp, 0 for the low temp, and 30 kts for the wind. Set Rain =0 to turn it off. If you live on Hawaii or Alaska, you may need to change these. In version 6.2a, these are saved in the config file.

BEGIN: The Automatic Packet Reporting System (APRS) is an ideal tool for reporting weather conditions via packet. The system is compatible with both human entry as well as automatic weather station entry of weather conditions. There is a \$9 serial interface option in APRS to accept the serial output of the ULTIMETER-II home weather station. With this connection, your wind conditions, temperature and optionally rain information are all automatically inserted into your position/weather report packet. You can even mount an Ultimeater-II remotely with only a TNC and Radio, and have it periodically report the remote weather conditions.

In the APRS system, current conditions at any station are broadcast to all stations on the net in a periodic fashion. Not only are these individual conditions available to all stations on the net, but also importantly, the location of these conditions are also displayed. There are several capabilities of APRS that are directly applicable to the SKYWARN:

MAP DISPLAY - Shows the location of all reporting stations, their wind speed and direction. Can also show the location of other objects, such as reports of TStorms, Hail, Tornados, etc. Now in version 6.0, you can mark large areas and send the borders either as a rectangle, circle, triangle, or lines. Use the OBJECTS-AREA symbol. Typically, use the color blue for thunderstorms, and red for tornados.

WEATHER ONLY - Using the normal J command, Just weather stations can be displayed on the map to eliminate the clutter of other packet stations. There is a WEATHER menu of commands, and the APRS N key will cycle through each APRS weather station in turn and display the weather conditions for each one in a box on top of the screen. The location of the displayed station is highlighted with a blue circle. Whenever a new report comes in from the selected station, the weather window is automatically

updated.

REPORT BROADCASTS - The individual station weather conditions can be manually placed in the Beacon Broadcast from each station or automatically using the APRS WX option (\$9) and ULTIMETER-II serial interface. These reports are typically broadcast every 10 minutes. The report is also available at anytime if an APRS user sends the WX station an APRS Query. There is a special WX query that will request all WX stations to immediately report.

STORM/HURRICANE TRACKING - Any station may place a storm or other object on his map, and the same symbol will be transmitted to all other stations in the net. This is ideal for transmitting the location of a storm or Hurricane. If the course and speed of advance of the storm is included in the position report, then the object will automatically be dead-reckoned on all screens until the next update. Any station can update the location of the storm as information becomes available. The updating station will automatically overwrite all posits in the net and will become the new reporting station for the object. This prevents duplicate reporting and eliminates dependency on reporting stations that might disappear and not update an object that they originated.

NOTE: Since APRS dead-reckons the position of moving objects as time progresses, the symbol on the map is presented where it SHOULD be, but NOT where it was when first reported. If you use the cursor to try to hook one of these objects on the map, you must hook the little gray circle which marks the position of the actual report, and not the symbol itself.

NATIONAL WEATHER SERVICE DISPLAY - KD4UYR in FLorida had written a data base program that would parse National Weather Service hourly bulletins into APRS compatible Backup files. After version 3.10, APRS has built-in commands to perform this function on line!. See below on the details.

OPERATOR MESSAGES - The Point-to-point message capability can be used for operator to operator messages and alerts.

COMMENTS - Transmitted along with each position report, there is a short comment field which can be used to report weather conditions, station status, intentions or other broadcast type information.

VEHICLE TRACKING - APRS can track the movements of any mobile with a GPS or LORAN receiver properly interfaced to a packet TNC.

SKYWARN APPLICATION: The map display has the capability of presenting both a station's position and his course and speed. APRS recognizes a special weather report indicator (W) so that all Wx reporting stations are highlighted in blue and the software recognizes that their course and speed indicators are for wind reporting and not for station course and speed. Note that APRS does not recognize 000 as North, but instead recognizes 360. A value of 000 is assumed to mean there is no wind direction available. Other than for the automatic ULTIMETER-II interface, the comment field can be used for a variety of free-format weather reports which can be tailored to the conditions at any time. Since a manually entered WX report should retain the time that it was valid, APRS will not update the date and time of each stations position (WX) report unless the automatic ULTIMETER-II interface is operating.

In addition to the weather data and comments on the Plist, the station Beacon Text is also available for broadcasting additional amplifying info. Any station running APRS simply calls up the LATEST display and sees the current conditions from all stations on one screen. Similarly, he calls up the map display and sees the location of all stations and all specially reported conditions. Any authorized station can insert the location of any special object on the map. The location of that reported object or condition is displayed on all screens in the network. Even non-packet voice stations making a weather report can be placed on the map (like an object) by another APRS packet operator. His station will appear similar to any other APRS weather station, except that his report will include a marker indicating that he was manually placed on the map by another operator. We have used APRS on weekends for reporting the Chesapeake Weather and Traffic net. Load the SKYWARN.BK file to see the APRS network during one of these nets. Also see the new section on how to load National Weather Service reports onto your APRS map.

NATIONAL WEATHER SERVICE HOURLY BULLETINS

KD4UYR Kevin, in Clearwater Florida wrote a database program to crunch the NWS hourly weather bulletins into APRS compatible BACKUP files. He could

then load them into APRS for display on the map. I have added this feature to APRS in the WEATHER menu. The GetNWS command will search the NWSposns.DAT file for all NWS stations within the boundaries of the current APRS map display. If the map is larger than 256 miles, then only a radius out to 250 miles is selected to prevent overloading the L and P lists. Similarly a minimum radius of 32 miles is also used to be sure that at least one NWS station is found. The database only had NWS locations to the nearest whole minute, so the positions are only accurate to the nearest mile or so. This process is my easy way of selecting the stations that you want to display.

The LOAD-WX-DATA command is used for loading the NWS data if available. This command will ask you for the name and path to a text file containing the downloaded NWS hourly reports. This file can be obtained from most of the commercial data servers or various BBS's. Do not ask me where to find them... The real WX nuts out there seem to have no trouble finding them, but in most cases it is a pay as you go service... APRS will then scan through the NWS bulletin file looking for each station that you have on your APRS P-LIST. If it finds a matching NWS bulletin, it will parse out the Wind speed/direction, the temperature and dew point and the barometric pressure and place these on the P-list. Then it will take the remainder of the report and place it in the L-list so that you can see the raw data which includes other notes about cloud cover and special conditions. In both cases, the time of the entry in the P and L-list will be the time of the NWS report (in local time). The date is assumed to be the current date.

Unfortunately, these reports were designed for human reading and are also generated by hand at all the NWS sites. There are frequently errors or improperly formatted reports. By looking at the L-List, most of these errors can be detected. If APRS can not make sense out of the report, it indicates with the words "garbled report" on the P-list. Once you have the display you like, you can select stations on the P-list for uplink to the net as desired. Since it is easy to generate lots of data and packets in this manner, I hope that stations will be considerate and not overload the channel. Once everyone on the net sees the reports, the uplinking station should consider Quitting to uplink in order to reduce QRM. Once the uplinked reports are no longer valid, the uplinking station should KILL them which will kill them from everyone's display (they will still be on everyone's P-list, however, for subsequent display using the SHOW command). Remember that KILL just marks them for NOT displaying so once you KILL them, you need to continue UPLINKING the KILL status for several beacon periods to be sure you killed everyone's version that is on the net.

DEMONSTRATION: To get an idea of how APRS works in a SKYWARN or other weather reporting environment, load the backup file SKYWARN.BK using the FILES-LOAD command. The stations would normally be bright blue, but all stations fade to gray if they have not been heard from in over 2 hours. Use the P command to pull up the position/weather reports and notice the format for the station W3AD0. That station is reporting the wind and temperature automatically using the optional ULTIMETER-II interface. To demonstrate the NWS capability, center your map on Florida at the 128 mile range enter the WEATHER-GET_NWS_SITES command. Once all the NWS stations appear on the map, then enter the WEATHER-LOAD_WX_FILE command to load the sample NWS data file provided by KD4UYR. Look at the P and L-lists to see what is going on...

ULTIMETER-II INTERFACE: To permit automatic weather station reporting, APRS includes an optional serial interface to the ULTIMETER-II home weather station.

(I offered to develop one for DAVIS instruments, but they call their data proprietary and will not share it with HAMS). The optional APRS WX routine is activated by a separate validation number (\$9). Once activated, APRS accepts the serial data output of the ULTIMETER-II and puts the information in your stations position/weather packet automatically for unattended weather reporting. (If you have a different home weather station that has a serial data output, and can convince me that it is worth the effort and widespread in the HAM community, let me know.) The ultimeter comes in two configurations which are not distinguishable by the user. One version outputs wind in MPH and the other in KPH. The user display can select either units, but the serial output is always the same. The difference is that the MPH units begin each line with a * while the KPH units begin each line with the # sign. In version 4.05, APRS recognizes this difference and converts the # units to MPH by dividing by 1.6.

RAIN VALUES: In the Ultimeter-II, two rain count accumulators are maintained. These are both incremented every time the rain gage clicks. The normal gage clicks every tenth of an inch of rain. A special order gage clicks every one-hundredth of an inch. In version 4.05 APRS asks you which gage you have so that all on the air reports are in tenths of an inch. Since the U-II values only have meaning if everyone knows when they were last reset, APRS keeps a running accumulation every 10 minutes for the last hour so that it

can compute and transmit only the difference in rain for the last 60 minutes. This way the rain reading has some meaning without prior knowledge by all stations receiving it. This rain/hour is intended for severe storm watches and other interest in real-time conditions. A reading of /R12 means that 1.2 inches fell in the last hour. After 60 minutes, this value will return to zero.

After my first heavy rain fall, I came home a few hours later and of course, the RAIN/HOUR report was then showing 0, since more than an hour had passes since the last rain! Obviously, this RAIN/HOUR is only good for skywarn, so I added a Precipitation field that shows the RAIN/DAY. This satisfies the curiosity of the casual APRS stations that just want to see how much rain we had during the last 24 hours. A reading of /P16 means that 1.6 inches have fallen since the same hour yesterday. The format we are now using looks something like this:

```
.../LAT/LONG/CSE/SPD/Txxx/Dxxx/Rxx/Pxx/Bxxx/free text comments...(auto)
```

Where CSE and SPD show the wind conditions
/T and /D are temperature and DewPoint
/R and /P are Rain per hour (tenths) and Rain/day (tenths)
/S is Snow per day (in INCHES) replaces Rain field
/B is barometric pressure in inches (ignoring the leading 2 or 3)
(auto) means it is an automatic report and therefore is current.
Any field not available is not included

With the WX interface enabled, the normal APRS decaying of position/wx reports still holds as long as nothing changes (except the wind). This way, redundant WX reports do not cloud the channel. If any value, Position, temperature, rain, barometric pressure, or comments change, then the periodicity is reset to the value set in the alt-SETUP-POsrate command. Since the wind is the most changing parameter, in version 5.9d I added the WX-WIND command to allow you to set a Wind threshold. Whenever the wind is above that threshold, the reporting period is also reset to the POsrate value. Nominally, you might want to set the POsrate value to about 4 minutes or so. This way, during changing WX conditions, or wind speeds above your threshold, the WX is reported every 4 minutes. Otherwise, the period rapidly decays back to the maximum APRS delay period (default is 15 minutes). For a weather station, you might want to change this MaxPeriod to about 10 minutes so that stations in the net get at least 6 wx reports per hour. To change this value, you must use a DOS editor to change it in your CFGxxx file. You will find it listed as 750, Maximum time period between packets. (750 seconds = 15 minutes). Of course, a WX/position report will be transmitted by the APRS station at anytime, in response to an APRS query; either an ALL NET Query, ?APRS, or a Wx only Query, ?WX, or a one station Query (by sending ?APRS in a message).

SERIAL INTERFACE CABLE: Peet Bros sells a serial interface cable with a DB-25 connector to RJ-11. (Note, this is a DB-25, not a DB-9). Since the ULTIMETER-II has no negative supply, a 5 K pull-down resistor is added to the DB-25 connector between Pins 2 and 3. This uses the -5 or -12 volts on the TXD line to bias the RXD line. When I plugged in a standard phone line connector to the ULTIMETER-II serial data output (unmarked connector on their junction box, or side of the Display unit), I found the data output on the green and black wire of the RJ-11. Black is data ground, and green was RXD. I do not know if the wire colors are standard but they would be either 1 and 3, or 2 and 4 depending on which side is up, and the ground is the one at the end. The Peet Bros cable includes transient protection and RF filtering to protect your computer as well as the bias resistor. Remember, the anemometer is like an antenna, high in the air. It can radiate RFI and take lightning charges...

REMOTE ULTIMETER-II OPERATION: There are two ways to combine a TNC and U-II for stand-alone remote operation. One uses the new features in the PACCOMM TNC to periodically transmit a WX report, and the other permits APRS stations to interrogate the WX conditions remotely. Here's how:

PACCOMM: Simply program the PACCOMM GPSSTRING parameter to recognize the * or # character instead of the usual GPS formats. Then set LOC to every 600 and GPS ON and the TNC will load the WX report into the TNC LText and transmit it once every 10 minutes. Also SET ECHO off! This is because the U-II uses a 10k resistor on the TXD line to bias the RXD line. If the TNC is echoing the U-II data, then total garbage results! (Thanks to Jeff, KD4GOE in Mobile, ALA for figuring that one out!)

OTHER TNC:

- 1) Install the U-II and a TNC at the remote site. Install a data switch so that U-II data is only input to the TNC when the TNC is connected by

- either wiring to the CONNECTED LED or to the DCD line if implemented
- 2) Place the TNC location in the BText using the usual APRS fixed format with the WX () symbol: !LLmm.xxN/LLmm.xxW_Remote U-II WX station...
- 3) If the TNC is also serving as a WIDE area APRS digi, place the word WIDE at the beginning of the comment field so that it shows up in green, and include a note that WX is available. Set MYA WIDE. Set your UNPROTO path to UNproto APRS via WIDE,WIDE... (assuming there are other WIDEs nearby)
- 4) Set LFIgnore ON. Set CHECK to 6 and AX25 off so that the WX connection will time out after 60 seconds.

At this point, any station connecting to the TNC will get the short ULTIMETER 15 character weather strings as long as they are connected. The following changes were made to APRS so that the connected station and all OTHER monitoring stations could see the data.

- a) APRS now looks for the U-II data (even if not transmitted to APRS) so everyone on frequency sees the WX displayed, although it is being transmitted via a CONNECTION to only one station.
- b) The station that connected to the TNC has to be able to see the data also. To enable this, he must first turn MCON ON so that he can monitor while connected, second, he must escape out of the APRS TALK mode so that APRS can process the data. In 5.00 you can use the alt-X key instead of ESC to return to APRS. Alt-X will leave your connection intact instead of forcing a Disconnect as it usually does. This feature is not documented anywhere else, since it only is useful here for WX.
- c) As long as you are connected to the remote TNC, the U-II data will be transmitted about once every 5 seconds.

Since the remote site can also be a WIDE area digipeater, it should show the WX circle symbol, but it will be GREEN to indicate it is also running with the ALIAS of WIDE. Whenever U-II data is transmitted, APRS will overwrite the digipeater position with the Ultemeter-II WX/posit report. The last WX heard will remain in the P-list and on the screen until the next BText is transmitted by the DIGI TNC.

We are encouraging the Manufacturer of the Ultemeter to make a HAM/TNC mod so that the U-II can be connected to a remote TNC and it will only output WX data once every 6 minutes or so. If the TNC is placed in the CONVERSE mode, these short WX reports will be transmitted. This type of operation will automatically update all APRS users of all remote site Weather conditions on a periodic basis. Until this new device is available, however, the system described above will work and will actually provide a more responsive display of short term weather conditions while someone is connected.

DATA LOGGING: The POSITION FILTER normally causes APRS to NOT save duplicate position reports that are within 80 yards of a previous report. When this filter is toggled OFF, it reduces this filter range to 20 yards AND enables all WXstation logging. In this mode, all WEATHER station reports are saved in a track history file. All over-the-air reports are only received once every 10 minutes, but your own report will be saved at the rate set by the Set-Pos-Rate command.

AUTOWX.EXE: This is a program written by Les, N5KOA to also interface the U-II to a TNC with a PC. It allows a direct connections for WX info, it does WX beacons in APRS format, and allows continuous logging of WX data to a binary file just like the U-II ULTIITSR program. I have not used nor tried this program. See Les's documentation in the AUTOWX.DOC file (in README directory)

FINAL NOTES: Since the WXstation option is always updating your outgoing position report, this makes it impossible for a WX station to report a beam heading during a Direction Finding evolution. If you use the BEAMHEADING command to enter a beam heading on a Fox or Jammer, then your WX station is disabled. To restore your WX station, restart the program.

\$\$\$ The ULTIMETER-II is available from PEET Bros 1-800-USA-PEET (872-7338) for \$179 plus \$20 for their Serial interface cable and \$60 for the optional rain guage (self emptying, reads in 0.1 inches) plus shipping of \$8.25. (For APRS, you don't need their \$40 software but it is a good package for doing the usual home WX logging and analysis) See adds in QST, CQ, Popular Mechanics, etc... (these were 1993 prices)

\$ The optional APRS registration for the ULTIMETER-II is available from the author for \$9 and may be ordered with APRS or as an option later.

Thanks. I've got the data format (with the underscore character) but I didn't know if an unknown wind speed and direction should be reported as 000 or not. 000 for wind speed and direction are valid for calm days. Seems like it might be hard to figure out who's got Wind Speed equipment on a calm day and who doesn't have the equipment. Now a negative wind speed could flag the data as being invalid. Wonder what APRS would do with a negative wind speed?

Bernard:

Greetings... Have you gotten the APRS software? APRS is just a program which connects the elements of a map with a packet position location system. The packets contain the call and position of the station. These positions are then shown on the map. If you had a GPS receiver connected to a laptop and a TNC/Radio, you could be seen moving on the map. Here in the northeast NYC area there are quite a number of users, alas, non of us move and looking at the map becomes quite a bore. I'm sure this will change as more users come aboard and they bring their \$\$\$ along.

I am also a sailor, I repaired a Pierson 26 and spend time out on the water. I leave her in the water during the winter and have gone out in Jan and Feb.

I am a retired New York City Police Officer, so I have a little time on my hands now and then. I am 39 years old and unfortunately had a little ticker trouble which forced me to retire. I take it easy.

Be well...Dave N2LZX

Hello Bernard,

The best thing to do is get the program zip files and go through the doc. You can ftp the Mac version from ftp.ucsd.edu hamradio/packet/tcpip/incoming. I think you will find a dos version in the same location, or close by. If not, you can download the latest version from the Frequency Forum BBS, 703-207-9622.

73,

Kent

APRS Enhancement.

Bob Bruninga (WB4APR) called me yesterday about a new feature he was implementing in the APRS protocol. This was a feature that he and I had discussed quite awhile back, but he had not finalized yet.

This new feature is something that I call SELECTIVE AREA QUERY. In the normal APRS protocol, you can send a QUERY to EVERYBODY which is:

?APRS?

You can also send a query to an INDIVIDUAL station by sending the same string as a MESSAGE to that station.

The new feature is the ability to send a QUERY to selected AREA and have ONLY those stations that fall within that area respond. The format of this new query is:

```

?APRS?<lat>,<long>,<dist>
?APRS?000.00,0000.00,0000
?ARRS?040.00,-104.00,0050

```

This example requests all stations within 50 miles of 40N 104W. The Lat and Long is in plus/minus decimal degrees and the distance is in miles. When a station sees this query, it determines if it meets the distance qualification, and if so, responds with a normal position report. If it is outside of the distance criteria, it simply ignores the query. Another nice thing about this query is that it is fully backward compatible since the older versions of APRS and MacAPRS will simply ignore what is after the ?APRS? and respond anyway.

I have not seen the implementation of this on the DOS program yet, but it involves using the cursor to move to the center of the region you want to query, selecting a distance, again with the cursor, then the command will get sent.

On the Mac version, this is done by holding down the Control-Key, and simply Click-Drag with the mouse from the Center of the region you want out to the radius you want. The program displays a dynamically changing circle showing the area covered, also showing the miles in the status bar at the bottom of the screen. When you release the mouse, the query command gets sent.

On the RECEIVING end, I display the queried area by drawing the appropriate circle on the map whenever one of these queries is received. If the query affects you, you hear a radar-sounding PING indicating that you have been queried. We have already had this up on the air and found it to be quite neat and fun.

The new version of MacAPRS that includes this is MacAPRS 1.2.1 and is up on ftp.ucsd.edu in the /hamradio/packet/tcpip/incoming directory.

Hi all !

My first version of APRS was version 5.9cn, which I got from G0MAM, the RSGB's Emergency Communications Officer. This version displayed U.K. National Grid Reference as well as Lat/Long in the top left of the screen, only when the cursor is

in the UK area.

I then got hold of version 6.2b (the latest) from the ARN BBS. I note that this version no longer displays NGR.

Does anybody know what happened to the NGR ? Was 5.9cn maybe a special version for the UK ?? I see no mention in the readme files.

P.S Hi Keith, WU2Z, I used to be a neighbour of yours (East Brunswick) I think we may have spoken on the Oldbridge repeater once ?

Pete GW0PJA / AA2DZ.

I asked a similar question when this list first came alive. I asked: What is APRS and how could I use it? What can we do with it? Is it practice? Is it hard to implement? I have an Icom GPS receiver, can I use this to get started? What kind of maps does it produce? Are there software maps that this will interface to? ...and so on into the night... I had one response with out much detail, other than it was great. I also would like the information. Is there a FAQ somewhere? I would like to be part of the packeteers that gets this thing going.

SOMEONE - TELL US ABOUT IT.

Hey guys, get a copy of the software and read the allabout.txt...this will
give you an overview. APRS is being used for entertainment, public service
and emergency planning!!! There's so much to do with it...just like our
hobby! Sorry this is short, but can we answer a specific question???

Dan N4WZR

I will do that. Again. Which has the best documentation, DOS or Mac?

Hi Steve,

Me and some others are planning on doing a few dog and pony shows in the Northern Virginia area and would like to look at your slides if you don't mind. Uuencoded Power Point files to me would be fine. I need to learn a little more about that type of encoding.

Thanks,

Kent

Why don't you leave them on the current TAPR ftp area (until the move in the next few weeks). anonymous login to TCET.UNT.EDU. Under tapr/UPLOAD

When we make the move, we can then put them in the APRSSIG area on TAPR.ORG. Each of the SIGs will have an ftp area on the new system.

Cheers - Greg

OK, here is my situation. I use a Kantronics KPC-9612 with KaGOLD software on a 386DX/40. I usually leave my computer on with KaGOLD running. When I exit KaGOLD, the TNC is left in host mode for a fast startup when I restart KaGOLD.

What do I need to do to run APRS without scrambling my TNC's parameters so that I can go between the two. I _can_ set KaGOLD to put the KPC-9612 in command mode when it exits.

I am interested in APRS, but not at the cost of confusion in my main operating mode.

Also, can APRS be run on an HP200LX (with a KPC-3)?

I downloaded all of the files from the FTP site and unzipped them. When I ran them, the program started, and I filled in all of the questions. When completed, it locked up and beeped at me. It said -Bad #! Check your APRS subdirectories.

Does anyone know anything about this? I am not sure where to go from here. The version is APRS63b. APRS62b acted the same way.
Thanks in advance.

If you use PKUNZIP -d APRSXXX.ZIP it will make its own subdirs and put the files in the right place.

MD APRS
CD APRS
PKUNZIP -d <path>APRS63B.ZIP

This should do it...

The TAPR APRS SIG is less then a month old. It has a subscriber list of just about 100 people, a couple of which are actually 'groups' of people at other sites.

Since the introduction of this SIG, there has been over 60 messages, Not bad for a group that just started...

As of yesterday, we now have Bob Bruninga, WB4APR, on this list too. I would like to welcome him to the TAPR APRS SIG. Bob is new to Internet E-Mail so I am not going to give his address out until he gets a little more comfortable with accessing his system.

Bob will be making version announcements etc via the APRS-SIG list server and will try to answer questions as they come in. At least for the moment, I do not expect him to check his E-Mail everyday, so don't be surprised if you don't get an immediate response from him.

I would like to thank TAPR for their enthusiastic support for this SIG and their rapid response to the couple minor problems that we have had with the ListServer.

I would also like to announce that I will be at the TAPR general meeting in March in St Louis, MO and will be presenting a paper about some of the enhancements to and interesting applications of APRS.

I will also be at the APRS/Skywarn/WX-Balloon mini-conference in Chicago on SuperBowl Sunday. (January 29) This is at the Wheaton Hamfest in Villa Park IL (Western suburb of Chicago). It is being held at the Odeum in Villa Park.

If you are going to be at either of these events, please look me up.

I suspec the problem is that he tied to use COM3-4. Version 63b was my firrst attempt at supporting COM3-4. I did it the only way permissible under Qbasic, and that was to simply POKE the hardware location of COM3 into the BIOS location for COM1 (similar for 4 & 2). I have all of my serial devices swithc selectible from COM1, so I have no way of testing this approach. I assume that for this to work, that the user must have set the SAME interrupts for both COM3 and COM1 or for COM4 and COM2.

Thats why the SELECT PORT prompt reads: COM (1, 2, or 3/4 maybe)
 I dont een have enuff room in APRS to follow up with an additional line of explanation! (When I tear apart the code and rebuild it, I should be able to find some more room)!

Has there been any discussion/plans/whatever of a Windows based version of APRS? I personally like to use my computer for lots of things and having it tied up with APRS makes it a bit of a pain. Also I usually run Windows NT and although APRS runs in a DOS window under NT, it requires a full screen window as I'm guessing it does direct video access of some sort.

Thanks to everyone for their help. I have solved the problem. Just like everyone else, I was in a hurry to view the product, and didn't read all of the documentation that is provided. In an obscure little file there is a statement that when unzipping the file, be sure to use the -d parameter. This will restore all of the needed subdirectories in their proper places. Now I know. I am still having a little trouble understanding the "demo" documentation. It doesn't all work as advertised, or again, I havn't found all the little clues that come from behind the fifth door on the left, on the third level, in the great hall of DOOM.

Thanks again.

Todd Little, Pegasus asks, "Has there been any discussion/plans/whatever
of a Windows based version of APRS? I personally like to use my computer
for lots of things and having it tied up with APRS makes it a bit of a
pain. Also I usually run Windows NT and although APRS runs in a DOS
window under NT, it requires a full screen window as I'm guessing it
does direct video access of some sort."

I received OS2 WARP from Santa and loaded it about a week ago. Once
I figured out what the launch pad was all about the first thing I did
was to fly APRS version 6.2a in a DOS then later in an OS2 window.
APRS ran fine in both cases and I was able to minimize the window and
for 30 minutes I played the Windows 3.1 game of solitaire and cleaned
up my hard drive. The whole time I was tending to other business the
computer kept beeping in its different tones as APRS continued to
crunch the TNC inputs. I also continued to transmit reports periodically.
When I finished playing I opened up the APRS window and all the different
lists grew and new stations had been plotted. Everything looked great.
The bottom line is that as far as I can tell WARP worked great if you
don't want to have APRS dominate your computer. I have since repeated
the success with version 6.3b of APRS.

45. TNC-2 1.1.9 Firmware Announcement

From: Greg Jones <gjones@tenet.edu>
Date: Tue, 10 Jan 1995 23:44:39 -0600 (CST)
To: tapr-bb@tapr.org (TAPR-BB mailing), aprssig@tapr.org (APRS SIG)
Message-ID: <199501110544.XAA02398@Alice-Thurman.tenet.edu>
Rendered body type: text/plain

TAPR TNC-2 Release 1.1.9 Tuesday, January 10th, 1995

TAPR is proud to announce the release of version 1.1.9 for the TNC-2. 1.1.9
EPROMS with command booklet will be available from the office starting
January 10th, 1995. 1.1.9 will replace the current 1.1.8a being distributed
by TAPR.

Release 1.1.9 incorporates these new features:

- o - Modified P-Persistence
- o - Enhanced monitor mode filtering
- o - Support for Dallas Semiconductor RSmartwatchS (tm) socket

- o - NMEA beaconing mode
- o - CW identification in FSK using the onboard packet modem

And these changes:

- o - The pound sign ASCII character "#" is allowed in callsigns
- o - The "OUT" command installed in version 1.1.8 is removed
- o - In addition to identification at 9.5 minute intervals, the HID function transmits an identification packet upon incoming connect acknowledge, outgoing connect attempt success, disconnection, and cancellation of outgoing connect attempts.
- o - DWAIT is now applied to digipeated and non-digipeated packets
- o - Delay equivalent to the current DCD backoff time is applied after transmit release to prevent multiple transmissions with extremely small delays in between

NMEA Beacon Function

=====

TNC-2 now incorporates a dedicated mode enabling the broadcast of one or two NMEA version 2.00 (and compatible) sentences to the UNPROTO address. When placed in NMEA mode with a non-zero value in the NMEABCN parameter, the TNC broadcasts the most recently received sentences received from the attached NMEA talker on the radio link. No other outgoing transmissions are permitted with the exception of identification, beacon, CTEXT, and mailbox data (*if supported).

NMEA devices provide an ASCII output at 4800 baud, 8/N/1, consisting of one or more types of sentences containing various types of data. Most commonly these data contain navigation fixes. For example, the authorUs global positioning system receiver (Garmin model GPS-55AVD) generates sentences containing the receiverUs longitude and latitude (fix), time of the fix, groundspeed, waypoint data, and the like.

An example:

```
$GPRMC,034523,Y,02754.31,N,08023.03,W,1.5,035,031294,4,W*23<cr><lf>
```

Meaning:

R\$GPRMCS - Indicates the type of data (RMC-minimum recommended GPS sentence)
 034523 - UTC hh/mm/ss
 Y - data valid
 02754.31,N - longitude
 08023.03,W - latitude
 1.5 - groundspeed
 035 - Track made good over the ground (degrees true)
 031294 - date ddmmyy
 4,W - magnetic variation, West
 23 - checksum (ignored by the TNC)

(Note that this example sentence was not actually generated by the unit and the checksum is probably wrong)

Modified P-Persistence

=====

P-persistence is a channel sharing technique that has gained great favor in the TCP/IP world. A modified form of P-persistence It is now included in TAPR TNC-2 as an alternative to prioritized acknowledgements and DWAIT.

Modified P-persistence relies on two principles to achieve a more equitable sharing of the common frequency. First, when the TNC waits a random multiple of DWAIT after hearing another station before it transmits. The upper limit of the random value is user defined by the PERSIST parameter to prevent frequency monopolization by stations placing unusually heavy demands on the frequency, as with the case of a file transfer. Modified P-persistence increases the likelihood that a station with higher priority traffic can acquire the channel.

The second way modified P-persistence promotes channel sharing is by gradually increasing the wait time when the TNC executes retry transmissions.

Modified P-persistence as implemented in TNC-2 differs from standard P-persistence in that acknowledged retries do not cause the time delays to cumulate. After a retry is successfully acknowledged the TNC reverts to the shorter delay that assumes a perfect channel. Another difference is that the retry delay is applied only to connections on stream A.

Monitoring Improvement

=====

The TNC will examine the contents of each monitored packet for nonprinting ASCII characters and discard the entire packet if at least one is detected. Nonprinting characters means any ASCII character less than the space character except for BELL, LF, and CR, and the DEL character. The test occurs after masking off the high order bit. By setting MNONPRIN to OFF, and in concert with MNONAX25 OFF, the TNC will filter nearly all screen-garbage inducing monitored packets.

The 1.1.9 TNC-2 executable is (c) 1994 InfoMotion, Inc. All rights reserved.

TNC-2 firmware is provided "AS-IS" AND THE USER ASSUMES THE ENTIRE RISK OF UTILIZING THE FIRMWARE. TNC-2 FIRMWARE IS NOT INTENDED NOR IS IT PROVIDED FOR ANY PURPOSE, INCLUDING NAVIGATION, WHEN FAILURE OF THE FIRMWARE, OR HARDWARE, OR BOTH, MIGHT CAUSE BODILY INJURY OR LOSS OF PROPERTY.

46. Ultimeter-II

From: <ROBERTST@BENNING-EMH1.ARMY.MIL>
Date: Wed, 11 Jan 95 08:33:25 EST
To: <aprssig@tapr.org>
Message-ID: <m0rS3Ck-0000TIC@dptspd.sat.datapoint.com>
Rendered body type: text/plain

In reading thru the documentation that comes with APRS one of the articles mentions using the Ultimeter and a TNC as a stand alone WX station. I hooked the TNC and Ultimeter up as stated and sure enough the Beacon contains data from the Ultimeter. Unfortunately the info is just a string of numbers similar to *0007600000000 or something thereabouts. When I use the WX option of APRS it works fine so I can only assume that APRS decodes this info into meaningful data. All this said and done how can you use the TNC and Ultimeter as a remote weather station if the Beacon Text does not contain the decoded WX info? I have also successfully used the AUTOWX program to transmit the weather data in an APRS accepted format however this requires a dedicated computer also. Hopefully I have overlooked something and someone can help me out.

Have looked under 128.54.16.7 or ucsd.edu in cd /hamradio/packet/tcpip/incoming
 and cd /hamradio/packet/tcpip/incoming
 or rather cd /hamradio/packet/aprs and no newer version than aprs6.2.

Is there another site it is posted at? I need it for my poor MS-DOS
 friends.

Does anyone know how to interface the Davis Instrument Weather Monitor II
 to an APRS system. I don't think it should have data coming out of it much
 different than the Ultimeter II. I noticed in the docs that there was some
 reason that the Davis could not be used. Something about not being able to
 supply source code. Do we really have to go into the thing that deep or do
 we just need the output of the unit defined. I spoke with Davis this
 morning, and they didn't seem to have a problem with defining the outputs.
 In fact, there is a software designers kit and disk available. I think it
 is \$99, but maybe a couple of us could chip in if the input/output could be
 defined for the APRS.
 Just a thought.
 Marvin - WB6PKK

Version 6.3b for MSDOS is available by anonymous ftp at 140.174.180.1.

It takes a while, as I think this is a slip link and is limited to 14.4K.

> meaningful data.

```

ANSWER: APRS decodes the raw data off the air! It doesnt have to be in the final APRS format. In order for APRS to know that the raw data is from an U-II, the remote TNC must have the WX symbol in its BText {_} and APRS will do the rest....

I agree, If someone will just define for me what the data looks like, and what it means, then I will be happy to add it to APRS for decoding the DAVIS outputs. So far, no-one has figured it out. I dont have one, so I cant experiment. Should be simple to do. Hook it put to PROCOMM and record a file for a few minutes. I would hope it should be obvious from then. (Of course, APRS is stuck SIZE wise, and I have to go re-modularize the code to make more room, before I can add anything onther that 1 or 2 lines...)

53. Cheap \$25 GPS!

Rendered body type: text/plain

Not really.... But Today I am going around to the local YACHT clubs and BOAT yards and posting a sign reading something like this: OLD LORANS WANTED! Will pay up to \$25! etc....

If GPS is selling as hot as everyone says it is, then there should be lots of junk LORANS being scrapped. Most have NMEA output and are perfectly compatible with APRS. Why shell out \$450 for a GPS toy when you can have just as much fun wiht a LORAN doing the same thing!? Sure, LORAN is only going to be around till 1999, but by then, GPS will only cost \$25 hi hi... You can buy brand new LORAN units for \$150 on sale, so a used clunker should be worth about \$25 unless you really want one, then go ahead an offer \$50 hi hi.

A properly placed call to any of a number of trucking companies that are abandoning their LORAN trackers for GPS units should also find hundreds of units. A few months ago, an article in 73 mag wrote up such a cheap surplused LORAN and the guy was selling them for \$25. He had 100 of them...

JUST BE SURE THE UNIT OUTPUTS NMEA GLL and VTG.

57. APRS telemetry system

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Wed, 11 Jan 1995 15:12:18 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950111150153.19496E-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

TELEMETRY.txt 6.3 APRS TELEMETRY SYSTEM
 Using the Micro.Interface.Module (MIM)

NOTE: THIS INFORMATION IS PRELIMINARY, AND ALTHOUGH A PROTOTYPE IS WORKING FINE, N3MIM AND I ARE STILL FINE TUNING THE PROTOCOLS AND FINAL DESIGN
***** Maybe we will be finished by DAYTON??

Carl Wick, N3MIM, has developed a simple, yet powerful Micro.Interface Module that can be used as a single chip APRS telemetry system. Although the intent of his original design was to make a very simple, light-weight, throw-away module for experimental balloon flights, his design has now evolved into a very useful APRS packet tool. Using one of the single chip microprocessors, he has implemented a complete TNC (transmitter only) on a chip. This chip has four analog inputs, five digital bit inputs, a receive audio input (for proper CSMA operation) and outputs PTT and AX.25 audio. The only external components besides the sensors themselves, are a crystal and a transmitter. (As of today, he is adding a simple 100 mw xmtr too!). The chip even uses digital synthesis to generate the audio waveform! The chip pin-out follows:

Analog 2 --0		0-- Analog 1
Analog 3 --0	M.I.M	0-- Analog 0
Rcv input --0		0-- Xtal
reset --0	AX.25	0-- Xtal
Gnd --0		0-- 5 volts
Input bit 0 --0	Telemetry	0-- AX.25 out
input bit 1 --0		0-- AX.25 out
input bit 2 --0	Chip	0-- Input bit 5
input bit 3 --0		0-- Input bit 4

APRS TELEMETRY RECEIVING SYSTEM: Any telemetry system requires a table of equations and labels to make the values useable at the receiver site. The problem with most experimental telemetry systems, is that the receiver system must be tailored for every new application. In the case of a one-time balloon launch, (or any experiment assembled to meet a schedule) the equations are not usually available until just hours or minutes before launch. This means that it is next to impossible to distribute the equations and parameter definitions to a large number of tracking stations and to be able to have receiving telemetry software ready to go.

For this reason, APRS has been designed to serve as a general purpose telemetry tracking system for the M.I.M. Using APRS it is possible to transmit the telemetry equations, parameter definitions and channel units IN REAL TIME! Once any APRS station receives these parameter transmissions, it is then ready to receive and to display the real-time telemetry values in the proper engineering units. A sketch of the APRS telemetry display is shown below:

PRELIMINARY!!! APRS CODE NOT YET FINISHED!!!

CHANNEL	UNITS	SAMPLES									
Serial #		15	16	17	18	19	20	21	22	23	24
Time	HHmm	1236	1246	1256	1306	1317	1327	1337	1347	1357	1407
Battery	volts	12.6	12.6	12.6	12.5	12.5	12.4	12.3	12.3	12.2	12.2
BTemp	deg.F	85.3	83.2	81.5	80.6	80.1	79.8	79.7	78.4	77.3	76.0
AirTemp	deg.F	96.8	96.8	97.0	97.4	97.8	98.2	98.6	99.0	99.4	99.8
Pres	mBars	986	975	936	927	918	854	823	817	798	754
Camera	bit	.	.	clik	.	.	.	clik	.	.	.
Chute	bit	off	off	off	off	off	off	off	off	off	off
SunSens	bit	on	.	on	.	on	.	on	.	on	.
10mXmtr	bit	on	.	.	on	.	.	.	on	.	.
ATVxmtr	bit	high	high	high	.	.	.	.	high	high	high

Notice that the M.I.M module transmits a value for each of its four analog channels and each of its five digital bits once every sample time. The sample periodicity can be set from any value from 1 second to 30 minutes depending on the application. Each sample includes a unique serial number. In addition, not only can the parameter name, units and equations be specified for each of the analog channels, but the word to be associated with either the 0 or 1 value of each digital bit can also be specified.

To configure all APRS stations to properly decode the telemetry from the M.I.M module, the net control station (or any other designated station in the APRS network) needs to transmit the proper parameter definition packets. These packets are transmitted as APRS messages TO the CALLSIGN of the M.I.M module. If the M.I.M module is using the callsign of N3MIM, then the parameter definition station would send the following three messages:

```
To N3MIM:PARM.Battery,BTemp,AirTemp,Pres,Camra,Chute,SunSens,GndSens,10m,ATV
To N3MIM:UNIT.Volts,deg.F,deg.F,Mbar,Clik,OPEN!,1,on,on,high
To N3MIM:EQNS.0,2.6,0,0,.53,-32,3.439.49,-32,3,18,1,1,0,1,1,0
```

The PARM format specifies the name of each of the nine parameters. The UNITS format specifies what units are to be displayed, and for the digital bits, show what label is associated with the digital condition. The EQNS format has three coefficients for each of the analog channels, and either a 1 or a 0 for each of the five digital channels to indicate which state is associated with the indicated label. This permits the payload designer to use 1's or 0's as convenient with his circuitry without being forced to always use 0 for OFF and 1 to mean ON. The three values for each of the analog channels are simply the coefficients of a quadratic equation:

Final value = $A \cdot X^2 + B \cdot X + C$ Where X is the M.I.M transmitted value

FORMAL SPECIFICATION: The specific format for the PARM, UNIT, and EQNS packets are shown below:

PARM,P1,P2,P3,P4,B1,B2,B3,B4,B5 Where Pn and Bn are the parameter names

UNIT,U1,U2,U3,U4,L1,L2,L3,L4,L5 Where Un are the units for analog ports and Ln are the labels for the bits

EQNS,A1,B1,C1,A2,B2,C2,A3,B3,C3,A4,B4,C4,x,x,x,x,x Where the An,Bn,Cn are the coefficients for each of the analog channels, and the x's are either 1 or 0 depending on which state matches the indicated BIT label.

PRELIMINARY INFO ONLY. MAYBE WE WILL FINISH BY DAYTON!!!!

58. Multiple CONSOLES at EOC centers

```
From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Wed, 11 Jan 1995 17:17:23 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950111170742.22954A-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain
```

We did a RACES drill last night at the county EOC. All I took was a laptop, and a special serial cable, and yet we put three different PC's in DIFFERENT rooms on the air. See the following text which has been added to README\OPS.txt:

RACES AND EMERGENCY OPERATIONS CENTERS: Dont overlook the fact, that a

handful of separate PC computers can ALL BE CONNECTED TO A SINGLE TNC AND RADIO! This fact can be used to create quite an impressive multi-station tactical communications system that will rival some 911 consoles! For now (im working on a slave mode in version 6.4) just designate one console as the APRS operator connected to the TNC in the normal fashion. Then connect all other consoles to just ground and RXD coming out of the TNC. This way ALL consoles see the tactical picture, and these SLAVE PC's are at the individual operator's disposal to zoom in, and hop from screen to screen to give them access to what ever info they need! Do not think that a big screen display is better. A single big screen is impressive, but actually useless. Only the person at the KEYBOARD of an APRS system can actually get any info from APRS. In our county, you need to be below the 8 mile scale to get an idea of what is going on at a crisis, and while you are zoomed in there, others need to be focusing on other parts of the county.

So just prepare your serial cable between the main APRS PC and the TNC to have several RCV only cables attached, and string them out throughout the EOC to any spare PC's in the building. That way, anyone at those PC's has INDEPENDENT access to all of the APRS info without bothering the APRS operator who is cursoring around like mad just trying to keep up with the traffic. Remember that these RCV only cables can be simply 2 conductor radio shack miniature zip cord. You can carry hundreds of feet of this stuff in the briefcase with your portable laptop!

NOTE, that only the APRS operator can introduce information into the APRS network (on the air) and that the slaves are just info access terminals to give other personnel access to that info. To make a true multiple console system, I need to define a SLAVE mode that does the following.

- 1) It turns off the automatic rejection of MY packets, so that all consoles can use the same EOC callsign, but still monitor what other consoles under the same call are doing.
- 2) I have to implement a RTS/CTS hardware handshaking BUSY signal, so that only one CONSOLE is sending to the TNC at a time.

Until I do these, however, the multiple RECEIVE console concept is a very powerful tool for allowing all of the EOC operators instant access to APRS displays.

P.S. The multiple RECEIVE consoles see what the main APRS op is putting into the system, because they see his DIGIPEATED packets. So they see what everyone else sees. If they dont see it, then the APRS op is NOT getting out...

Bob,

After talking to you today abt the EOC exercise I realized I'd forgotten one item. There were lots of bulletins posted last night. They were beginning to scroll off the screen when I hit the "B". During a real emergency it may be helpful to enable paging similar to positions and beacons. My apologies if it was just operator ignorance. BTW tnx for the hard work on APRS.

What is the advantage of the Davis Weather Monitor over the Ultimeter? Did
you compare the two, or did you already have the former before becoming
interested in APRS?

67. APRS63B fatal error

From: Kent Larson <klarson@access.digex.net>
Date: Thu, 12 Jan 1995 22:56:01 -0500 (EST)
To: APRSSIG <aprssig@tapr.org>
Message-ID: <Pine.SUN.3.91.950112224900.19897A-100000@access3.digex.net>
Rendered body type: text/plain

Bob,

Moved APRS63b off my big machine to a 386 40 and am now getting -

"String space corrupt in module APRS63X at address 12F6:CE65

Hit any key to return to system"

Does this error tell me something about my system? Havn't heard anyone else having a problem. This is the computer we are planning on using at Winterfest so let me know ASAP if you think I have a system problem.

Also, one tablet is working great and Dan is working on the other one. I have a Vienna map made and will try to uuencode it in a message.

Dan, a couple of other APRS'rs and myself will be at the Richmond Frostfest this Sunday. You going to make it?

Kent

>I sure could use a detailed description of the functions of the various
>UNPROTO commands "RELAY,GATE,WIDE,ECHO" and the pros and cons of using
>each and under what circumstances.

First I'll give a description of the four types of digipeaters and then some discussion on how you should and shouldn't use them...

****IMPORTANT**** Don't put more than one RELAY or ECHO in a row in your UNPROTO path. Don't put more than two of ***ANY*** type in a row ever.

WIDE = For VHF use. A WIDE is a digipeater covering a large geographic area (or at least a strategic one). A station shouldn't be a WIDE if it has a small coverage area, is not up most of the time, or provides coverage over the same area as another WIDE. Two wides with the same coverage area cause lots of collisions. Avoid setting

up a WIDE unless you know it won't hurt anything.

RELAY = For VHF use. A RELAY station is a digi that does not have a large enough coverage to warrant it being called a WIDE. Most stations set their alias to RELAY so that stations with poor coverage can digi through them to a WIDE.

ECHO = For HF use. The same as RELAY.

GATE = A gateway between HF and VHF. I think most gateways repeat the packet on both VHF and HF so they can act much like RELAY or ECHO, but they also transmit on the other band as well.

* IMPORTANT: *

As for how to use these, don't *EVER* put more than two of the same type in a row. If you do then you will cause a packet storm as the packets bounce back and forth between the two stations.

With RELAY and ECHO (especially ECHO) never use more than ONE in a row or you will just cause collisions. ECHO's and RELAY's can't hear each other most of the time and will transmit on top of each other causing needless interference! GATE's and WIDE's are assumed to have a large enough coverage circle that this isn't a problem.

Use ECHO sparingly or *NOT AT ALL*. ECHO can cause lots of problems on HF because of the way the signals propagate. Using two ECHO's in a row can clog up an HF frequency really fast.

Use call signs whenever practical. On VHF "WIDE,WIDE" will give you the best coverage. If you know the call of the closest wide (look at the map!!) use the call (ie: "WA2NPP,WIDE" instead of "WIDE,WIDE".) You probably want to leave the second WIDE alone so that "WA2NPP", or whoever, can digi through all the WIDE's it can reach.

If you can't hit a WIDE directly then go through a RELAY. Once you find one that works, try using it's callsign instead of "RELAY". (ie: start out with "RELAY,WIDE,WIDE" and then when you find a good relay to use switch to using the callsign "KB2ICI,WIDE,WIDE".)

For a VHF station try "WIDE,WIDE" or "WIDE,GATE" (if there is a GATE around)

For an HF station try "GATE,WIDE"

NEVER *NEVER* *NEVER* use "WIDE,WIDE,WIDE" unless you like causing problems for others. Your packet can bounce around for a minute or more in some areas of the country (like the NY metro area!)

NEVER *NEVER* *NEVER* use "ECHO, ECHO" unless you like causing the same problems on HF.

These are general rules. Once you become familiar with your operating channel then you can perhaps break some of these rules. If you do, please check every so often to make sure nothing has changed and that it is still ok to operate that way.

(I'm not an APRS guru, but I play one on TV!)

71. Re: [APRSSIG:94] Re: FUNCTION of "RELAY,GATE,etc."

Rendered body type: text/plain

Another thing to remember on setting paths is that you can save multiple paths with the "D" operations "D"igipath sa"V"e command. It shows that you can save 13 different digi paths.

A good way of seeing who you should have in your digipath is to go to the "D"igipeaters screen. On version 6.2 and above, if you are hearing another station direct there will be a "*" to the left of that station's call. You can make any of those stations your first "hop".

As normal, I probably made this seem as clear as mud.

Who created the MScentrl map? I have gotten a few people interested in APRS in the area north of here (Starkville). The interested people are in Northeastern MS, and they will be wanting a little better map for that area (acutally they will want A map..there's nothing but the basic map). I would like to get in touch with whoever made the mscentrl map and see if they would be interested in making a northeast MS map. From the way it looks right now, northeast and central MS may be picking up APRS activity soon.

Thanks for any info,
Craig

I think that MSCENTL.MAP was one that Bob (WB4APR) did using the USGS CD-ROM. The 8th line of the "Map" indicates that is from the 2,000,000 to 1 ROM, and WB4APR is the most prolific CD-ROM mapmaker.

Normally I'd volunteer, but I've committed to finishing off part of Ohio covered by the Wilmington Nat. Wx. Center prior to spring, and taken on Southern MI.

But, if you know someone who would like to make maps, I'd be more than happy to help get them started.

Rendered body type: text/plain

Well, with a spirt of growth over the last week, with 9 WIDES between central VA and NY city, plus lots of "hidden (personal)" wides, we are starting to hear some forever packets wirling around. I saw one guy with a SEVEN line BULLETIN going via digi1,WIDE,digi2,WIDE,WIDE,WIDE. WWhen I pointed out that he is generating the potential for OVER 4000 packets every 10 minutes, I convinced him that he could cover the same area from NYCity to VA with digi1,WIDE,digi2,digi3,digi4 and that no-one would ever hear more than 2. That is a 2000 to 1 reduction in QRM by using one's head....

I also saw something like digi1,WIDE,RELAY,WIDE. Now assuming that 10 APRS stations (all acting as RELAY of course) all digipeated the packet,

AT EACH OF THE 4 WIDES THAT HEARD THE digi1 packet, then we have 40 packets then ready to hit the remaining 8 WIDES that will now all hear the 40, and you have 320 packets PER PACKET From that station. THIS IS CRAZY! NEVER use RELAY in ANY position EXCEPT THE FIRST, and once you know who is digipeating you, WHY EVEN DO IT THEN?!

RELAY is only there for areas without permanent WIDES. Once you have identified high VHF sites, they should be WIDE if anything..

Much of these problems will go away if we can get the TNC writers to implement my WIDE-N algorithm. But until then, we gotta be smart. I agree with the other comments, that if there are 3 or more WIDES that can hear each other ANYWHERE, then NEVER send a W,W,W. (27 packets result).

AND FINALLY, lets be NICE to each other... Just because someone has W,W,W in his DIGI list on the D page, dont jump on him. He might be doing something special... But after holding your breath for 5 minutes, then tell him... hi hi Similarly, I see NO reason why anyone should be using ECHO on HF (unless they are in extremis or a special event). Even then, ECHO is probably useless. He is much better off picking a far away, but solid station and using him ONLY as a digi. AGAIN, though, ONLY FOR SPECIAL. I want to encourage everyone NOT TO DIGI in general on HF, because it distroys the statistics on the HEARD LOG. That HEARD page is a valuable resource for determining propogation. If someone digipeats, then nobody knows if the band is open, or just that someone is bouncing in via a different direction. I spect this will not be the last we will hear about digipeating, hi hi.... :)

Rendered body type: text/plain

A week ago, I announced the APRS telemetry system based on the N3MIM single CHIP Micro Interface Module, which is a complete AX.25 8 channel telemetry TNC (transmit only) on a chip. The original intent of this MIM module was to make a match box sized throw-away PACKET balloon payload. Now consider an application much closer to home for the APRS commuter:

TRAFFIC monitoring MILE posts! This is a neat idea! Given that HAMS will be commuting with APRS moving Map displays, why not build a match box sized traffic SPEED detector (solar powered MIM module) that can be stuck on the side of a highway pole ? With a \$1.29 crystal MIC from radio shack, use DSP to figure out the speed of the traffic based on audio analysis! Beacon this SPEED once every two minutes at about 10 mW. The beacon will, of coure, include the LOCATION of the device. What the APRS commuter sees on his MAP is these MILE posts ahead of him showing traffic speeds! He can then decide on alternate routing!

We have plenty of room in the MIM to add this DSP (maybe), IS THERE ANYONE OUT THERE THAT IS INTO DSP THAT CAN DETERMINE THE ALGORITHM TO DETERMINE SPEED FROM THE AUDIO OF TRAFFIC????????? (or the amplitude fluctuations of a photo cell?) NO Doppler X band or road sensors please, This thing has to be autonomous and VERY small to be able to be SOLAR powered and able to be COVERTLY installed with out a lot of STATE HIGHWAY bureaucracy.

To support these MILEPOSTS, I am going to add the "m" character to the APRS symbols list. It will appear something like a SIGNPOST on the map, but instead of displaying a CALLSIGN, it will dispplay a VALUE. In this case, the sign will display "60" if the traffic is moving at 60 MPH... etc. This sign post symbol can be used by other STAND ALONE packet telemetry devices that need to announce certain conditions on a map. For example, Water or FLOOD levels....

>(or the amplitude fluctuations of a photo cell?) NO Doppler X band
>or road sensors please, This thing has to be autonomous and VERY small
>to be able to be SOLAR powered and able to be COVERTLY installed with
>out a lot of STATE HIGHWAY bureaucracy.

Actually, Doppler X band may not be a bad place to start with this. I have a 10 GHz Gunnplexer that came from a motion detector. It runs on about 6 VDC and puts out a very clean audio tone from its detector diode when it sees a moving object. The frequency of the tone represents the difference of the fundamental gunnplexer frequency and the Doppler shifted frequency of the signal bouncing off the moving object. I connect this to the input of a Radio Shack self contained audio amplifier and listen to it with headphones. Granted, it is not as small as a condensor microphone, but the output signal would be much easier to work with. These Gunnplexers are sometimes available at hamfests, and contacting some local alarm companies may have good results too.

Yes, I have no real problem with the SIZE of the 10Ghz gunplexor as a traffic speed sensor, but I am concerned about the POWER consumed. If I remember corectly, we are talking about lots of MA. DO you recall? Of course, since you wil only be generating a traffic speed value once every N minutes, then can the Gplexor be turned on and off relatively shortly? Probably so, since drift is meaningless, since it is only the doppler diffenrence we are listening to...

But I though we would have to monitor continuously to get a smoooth average of the traffic speed. But with something as accurate as a doppler device, then maybe that wouldnt matter either.

You are certainly correct that it would only take a few lines of code int he MIM telemetry chip to determine the audio tone!!!

Although I am no longer an interstate commuter, if I was, I WOULD be working on this for my own self interest! hi hi. Of course those guys spend so much time in their cars, that they dont have time to play circuits! oh well...

Audio detection can be used to accurately measure speed. I was involved in a missile test range project a few years back where we used microphones spaced at a precise distance to record the speed of a missile going about 5000' per second. Seems to me you could do the same by detecting an audio pattern taken from pickup microphones that were located a known distance apart. Distance moved in some interval of time equals speed.

How do you intend to handle multiple targets, and not having that blow your average? Or the doppler shift created in the window of a faster vehicle passing a slower vehicle? (I assume your talking about pointing the 'plexor into traffic, and not across...)

Seems that using using something that takes advantage of a vehicle detuning a tuned circuit or somesuch might work better...

85. Balloon launch

From: Richard Matthews <Richard_Matthews@shsvsmtplib.huntsville.sparta.com>
Date: Fri, 20 Jan 1995 16:26:40 -0600
To: aprssig <aprssig@tapr.org>
Message-ID: <199501201626407942@shsvsmtplib.huntsville.sparta.com>
Rendered body type: text/plain

The following has just been released by the ARRL

Balloon launch January 21

A balloon carrying Amateur Radio is planned for launch January 21
from Boone, Iowa, by a group calling itself the Iowa Balloon
Scientists.

Payloads will include a transmitter sending global positioning
information on 446.000 with transmissions at bursts of 9600 baud
once per second;

A packet digipeater on 145.550 (-0.600 split), running approximately
one watt and switched on and off at 15 minute intervals;

A 144/440 MHz crossband voice repeater (listen on 437.250 (plus or
minus) FM. There may be some temperature drift. The uplink
frequency is uncertain at this time and will be provided on the
packet beacon. Since this is the first flight for this payload,
there may be less than optimum operating conditions.

The packet digipeater and voice crossband repeater will alternate at
15 minute intervals, with changes planned for 00, 15, 30, and 45
minutes after the hour.

Interested amateurs are advised to monitor beacons for details on
other payloads and operating schedules.

The launch is planned for 1500 UTC. An HF coordination net will
meet on 7.155 MHz LSB beginning at 1430 UTC with N0AN as net control
station.

Information from Barry Buelow, WA0RJT.

Will this balloon be track by the APRS system? If so what plans are being made
for tracking?

wa4nww, Richard

Maybe something could be done with laser diodes and detectors. I doubt that
even the most sophisticated DSP could make sense of the audio generated by a
four lane interstate. A Gunplexer pointed at one lane of traffic will

generate a strong set of signals from the traffic in that lane, and some weaker singles from the traffic in adjacent lanes.

Laser detection would be more precise, but we'd have to figure out how the pros do it.

Rendered body type: text/plain

Well, This mornings thoughts on the Traffic Mile posts for vehicle speed detection and placement on the APRS moving map display, has flipped over to the Gunnplexor DOppler systems. I scanned a few mags, however, and cannot find any surplus or hobby electronics stores that are selling cheap motion detector gunplexors. If anyone knows of a place... Lemme know.

Yes, unfortunately, the inbound/outbound monitoring is a pain. Any one instrument, will only pick up one direction. So now you only have one marker on the map. for only one direction. The graphics that I have implemented allows a 3 digit numeral on the signpost. For example 55E would mean that this is an eastbound sensor and that the traffic is doing about 55. Actually, since COMMON CONGESTION points are RARELY symmetrical on both sides of the highway, this is not that much of a problem. The best place to put a detector (to give you advance warning at a decision point) going in in the morning will almost never be the same place where you will need another data point coming home.

Again, If anyone knows of a reproducible source of Gunn diode front ends, lemme know.

You might want to check with AMRAD. A while back they were hot and heavy into the motion detector variety and may know of a source. They were selling for about \$15. I once brought a bunch of test equipment to a tuning part they had. Dave Rogers (N4JGQ) got mine for me.

Any thoughts on using laser diodes and detectors? They would be much more selective than the Gunnplexers...

Jack

> four lane interstate. A Gunnplexer pointed at one lane of traffic will
> generate a strong set of signals from the traffic in that lane, and some
> weaker singles from the traffic in adjacent lanes.
>
> Laser detection would be more precise, but we'd have to figure out how the
> pros do it.

The pros have done this, so it's only a matter of finding out how.

A source for the pros is...the California Department of Transportation.
Check out the WWW page available for traffic conditions in the San Diego
area. They give information such as average vehicle speed in each lane for
the major freeways in the area. Really cool stuff. Address is:

<http://www.scubed.com:8001/caltrans/sd/sd-transnet.html>

Now if we just had high-speed internet connections in our cars....hi hi.

Charles

Receiving a lazer diode would be far beyond our capability I would
think. The beauty of a GUNN oscillator is that it is its own LO so just
DC goes in and audio doppler comes out. DOnno how you would get doppler
info from optical frequencies. Without some very expensive stuff....

MacAPRS 1.2.6 is now up at ftp.ucsd.edu

Currently it is in /hamradio/packet/tcpip/incoming.
However it may get moved to /hamradio/packet/aprs.

In the future, you need to check both places for the most recent version.
The INCOMING directory is where I am allowed to put it, then eventually, it
will get moved to the APRS directory..

Take a look at the FEB 95 issue of 73 Magazine Homeing In column. It has a
good article about the Macintosh version of APRS. It also shows a preview
of the new map files I am working on. These are maps based on the 1:100,000
scale USGS CD-ROMs and show the STREET level!!!

The JAN 95 issue of 73 Magazine has a good article on the PC version.

I will be at the Wheaton Hamfest (Chicago IL) this weekend giving talks about APRS, Skywarn, and Ballooning. If you are going to be there, please look me up.

New features in 1.2.6

- * Automatic Station Time out

This allows you to 'automatically' delete stations that have not been seen for a specified amount of time (in Hours).

- * Message Acknowledgments.

When you receive a message, it IMMEDIATELY response with the ACK. This fixes the problem of receiving two messages back-to-back and only acknowledging the last one.

- * VHF/HF recognition.

If you have a DSP-2232 or a PK-900, The STATION LIST will show you which radio-port each station came in on. It shows Port ONE in RED and Port TWO in BLUE. This has proven to be VERY useful in showing band activity, etc.

This feature is being expanded to also support KAM units, but KAM port recognition is not finished yet.

- * Some of the WEATHER logging/display has been cleaned up.

- * The Statistics window has some new features.

- * In BOTH the Weather Chart window and the STATISTICS CHART window, if you hold down the OPTION key and click in a chart, it will show you the averages and maximums.

- * Automatic Startup

The Automatic startup features have been increased to include TNC input and Weather input.

Subj: NTBP #6 ANNOUNCEMENT The North Texas balloon project

Orginal post on AMSAT-BB by Doug KG50A

The North Texas balloon project will launch it's sixth high altitude balloon experiment carrying amateur radio payloads on the 4th of

February, 1995. The payload carries a variety radios and instruments that can be easily used by any amateur with a Technicians license or above.

The launch will be from Cleburn or Cliffton, Texas at approximately 8:00 to 8:30 AM. In the event of inclement weather, the launch will be delayed to the next day, and then to the next Saturday (the 11th). There will be a pre-launch net at 8:30 PM on the Ft.Worth 146.76 repeater the evening before the launch. The morning of launch there will be an HF net on 7.155 MHz +/- QRM. The Net control station will probably be W5IU.

Approximately two hours after launch, the balloon is expected to reach an altitude of 100,000 to 105,000 feet before burst. At this altitude the area of visibility will be about 400 miles in any direction for a total 800 miles communications range. In past missions, there have been QSO's between Corpus Christi, TX and Salina, Kansas.

The following is a list of the available experiments onboard:

Crossband FM Voice Repeater:

There will be a crossband FM repeater open to all. The uplink frequency will be 147.580 MHz and the Downlink will be on 445.850 MHz.

Packet Telemetry on 144.290 MHz:

This receive only packed information will be the data downlink of the mission. The packet format is the common 1200 baud AFSK found in all TNC's. The data will be presented in an easy to read format and no conversions will be required.

GPS:

Precise longitude, latitude and altitude data will be provided by a donated Rockwell NavCore V GPS receiver. The following data will be measured and can be seen on the 144.290 MHz packet downlink:

* UTC day and time	* Longitude	* Latitude
* Altitude	* Bearing	* Velocity
* Velocity up		

Telemetry

There will be onboard 12 bit, 8 channel Analog to Digital converter. Seven of the eight channels are used to measure the following:

* Inside Temperature	* Outside Temperature
* Barometric Altitude	* Main Battery Voltage
* ATV Battery Voltage	* Alkaline Test Battery Voltage
* NiCad Test Battery Voltage	

ATV

There will be a live, full motion, Amateur Television camera and 10 Watt transmitter onboard. The downlink frequency will be 439.250 MHz. This frequency was chosen to exactly correspond to Cable channel # 60. With an outdoor TV antenna (or other 440 MHz antenna) and the TV tuned to Cable channel 60, it is anticipated that an acceptable pictures can be obtained.

The camera will be remotely pointed via ground command to any of 256 possible positions.

QSL's can be had through KG50A via the Callbook address.

----- -End of cross posting -----

It would be nice if a ground station could retransmit the location in APRS format via the Crossband FM Voice Repeater. This would help get APRS moving in Dallas.

I don't know how it's done, but there are a number of kits and plenty of
information on how do set up lightwave communications systems with lasers.

Seems if the laser diode is modulated with a signal, then a detector used to
receive the reflected signal the two could be compared.

Perhaps the diode could be pulsed at a known rate, then the pulses recovered
by a detector, and the frequency of the pulses compared.

It's only advantage over Gunnplexers is the increased selectivity. If aimed
right at one lane, you will probably have only one set of signals to work
with.

I hv downloaded the 1.2.6 version of MacAPRS. It has a few more enhancements.
1. How do I use or access the "enable deleted" feature I see it in the menu
as an item but how do I mark or select a station/object to be deleted and at what interval?
2. How do I "ping" in the Mac version?
73
BTW TNX for the update!

Downloaded APRSBETA from ARN BBS and running it on main system with the ULII on Comm 2 - no problems so far.

I am trying something different with the maps I am making for the folks up in MI. I'm using the small square symbol to show the location of smaller towns at the 16 mi range, then putting the name in at 8 mi. I figure this beat using a ton of points trying to draw the outline of the towns off of outdated maps.

This leads to the problem where I might be running out of "labels" on maps with a lot of small towns. Would it be possible to pump up the number of labels allowable in some future version ?

BTW - I'll be taking the Thursday before Dayton off to track everyone coming thru town. Stop by if ya get a chance and I'll buy ya a cup of coffee.

OHMAPS02.Zip is available for DL from both ARN BBS and APRS OHIO BBS if you haven't gotten a copy so far.

The ARN BBS has been the principal distributor for APRS software since Bob started writing it. I don't mind at all putting it up on TAPR also whenever Bob releases an update.

Yes I am using the ULII and it is working fine with APRSBETA. It is updating and beaconing out properly. I have not yet put Beta on the 8088 laptop with the LCD CGA screen. (That's why I use few points on my maps.) I did get one crash when it was doing a screen redraw yesterday. The following represents the screen at the time of crash:

```
***
LM,PM: 10      12
a,I,J,K,fdx,LDx: 0  48  1  73  0  0
X,Y,X1,Y1 134.6432  348.6307 -229.1724 -269.9749
A$ Q
c$
E$$in loop
000PP! ERR number 5      Hit ENTER to return to DOS?
```

I was in VGA Mode at the time.
I hope this helps.

APRS Meetings at Wheaton Hamfest Chicago, IL
Jan 29, 1995

The Wheaton Hamfest sponsored an APRS/Balloon/Skywarn series of presentations this past weekend. This Hamfest was in Villa Park, ILL a northern suburb of Chicago close to O'Hair airport.

Among the people giving these presentations where:

KA9NHL, David Chesser
N9LCI, Ed Rodgers
N9LTD, David Mullenix
WU2Z, Keith Sproul

The topics presented where:

- * Introduction to APRS (N9LCI)
- * APRS and Skywarn/Weather (WU2Z)
- * APRS and Ballooning (N9LTD & WU2Z)

Although we had somewhat of a small room, we had lots of interest and Standing-Room-Only for most of the day.

During the Skywarn/Weather discussions, we had a lot of good input from weather people, discussing weather alarms and automated ways to get weather information. I also had some good discussions off-line with some Skywarn people about what types of information they wanted and when. As a result of these discussions, I have now implemented the Weather Alarm capabilities in the Macintosh version of APRS (Version 1.3.0 which should be out later this week).

David Mullenix (N9LTD) gave a very good presentation about Ballooning in general. This was followed by computer play-backs of the GPS data from three of the balloon flights that they had done this past summer.

=====
PACCOMM INTRODUCES THE PICO PACKET.

(Note: This is being done from memory and may not be exact)

Paccomm introduced the newest and tiniest TNC! This is a little black box smaller than a pack of cigarettes, that has several different options. In its normal configuration, it will be about the same price as the Tiny-2, and it will have several add-on options.

Add On Options:

- * Second Serial Port for hooking up a GPS receiver!!!!!!
- * More Memory (up to a meg or so) for mail-box type operations

This unit is VERY HOT, and should be available by Dayton!!

(IMHO) THIS THING IS AN APRS PERSONS DREAM COME TRUE!!!!

Keith,

I have briefly taken a look at APRS63.B, and can imagine several SKYWARN applications. I have given the software to 2 emergency management directors in the area.

Here at Tulsa, we have a TEXNET node in the NWS office that is automatically fed SKYWARN information, including an ASCII file that can be used to construct a radar image. The system works great, but lacks the ability to autofoward the warning messages from the server. If this could be done, then everyone in the area on the frequency could receive the warning at once, which would be a great service to the area civil defense agencies.

Any thoughts on how APRS could handle being automatically fed data, and then rebroadcasting it to all?

Concerning APRS automatically forwarding NWS bulletin info, ITS ALREADY DONE! Take a look at the NWSPARSE.bas program. I wrote it to parse incoming NWS bulletins on a COMM port and to output TO A TNC on the other COMM port all of the things that might be of interest. It automatically grabs and makes POSITION reports of the following things:

Tropical storms, hurricanes, 4, 8, 16, and 24 hour forecast positions, and anything else that it can find associated with a posit.

This program is in SOURCE code in QUICK BASIC so that ANYONE can add to it to parse anything else that can be extracted. My initial attempt was just to get it going and to show what it could be made to do. I did it for the SKYWARN guys in FLorida, clearwater, KR4US at the EOC.

It is a stand alone program that DOES NOTHING ELSE. In fact, it can share a single COMM port by bringing in NWS data on RXD and outputting to the TNC on TXD.

If anyone is going to make MODS to the program (I hope they do!) then lets coordinate so that we dont overlap our efforts. As you add additional parsing structure or otehrwise mod the code, be sure to keep track of your mods so that you can tell me. For each of you taht is making mods to this code, be sure to give it a NEW NAME and distribute it that way, so that we can all keep track of the evolution. If you keep good notes on the MODS and make it siimple for me to understand, then I will add your MODS to the distro copy...

By writing NWSPARSE.bas, I was able to take a four page NWS bulletin and extract almost all of the useful information and output it as about 6 APRS packets (position reports of the present and future posits). The first thing I would like someone to add, is to take the circles of 34, or 60 or 100 knot winds and generate APRS circles POSITS to show on the MAP!

etc.....

2. TELEMTRY and v6.5

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>

Rendered body type: text/plain

OK, its done (or will be by the time you see this I hope). Version 6.5 is out after a brief BETA test. The major change was LOTS of internal moving around to make room for more code so that I could add the following:

- 1) TELEMTRY system (see TELEMTRY.txt)
 - 2) Finer resoulution text on the maps (and all other pages too)
 - 3) Uses EGA/VGA screen paging so that the MAP does NOT have to be redrawn when switching between screens! Should make 286's much more friendly!
 - 4) A new CAMAPS02.ZIP has been posted
 - 5) Even if you are not in-to the TELEMTRY, take a look at the 1/4 cubic inch 2m transmitter for \$99 from AGRELLO Engineering. Will make a VERY compact stand alone tracker. He will stock 145.79 XTALS, call him!
 - 6) Can't wait to get my hands on a PICO-TNC from PACCOMM. It is very TINY too.
 - 7) All this effort on 6.5 has delayed my progress on the single chip APRS MIC-ENCODER. But I had to make room in APRS for the new compressed APRS decoding so that I can now proceed to finish the xmission of the new compressed format... hi hi
- Enuff fo now...

3. APRS & USGS Data Files

From: csetzer@rmii.com (Craig Setzer)

Rendered body type: text/plain

Greetings,

I have downloaded some USGS DLG files from their ftp site. They came in three formats, .STD, .OPT, and .GRA. I have tried to use the MAPFIX program from the APRS6.2 software zip but the program crashes with an ERROR 15.

My question is, "Does anyone have any experience using these files with aprs software? If so, would you email me. I am trying to create more detailed maps for Colorado.

Thanks in advance,

Craig Setzer

Anymore updates to the MacAPRS software? I thought I saw ver 1.3.0 mentioned.

I looked on 128.54.16.7 "incoming" latest there is 1.2.6.

The Mapfix program uses the OPT files, and requires the XTRACT.EXE program to get the needed information from the files for the 1:2,000,000 files. To use the 1:100,000 files, you will need to run the infomation thru either WB4APR's 100toGRF.bas or W7KKE's CONV100.bas (I've had better luck with CONV100.bas).

The first time I tried making maps this way, it took a couple of days to figure out how to do it. (The docs always makes it seem easier than it is, just like the DF functions...hi...hi.)

I tried this route for map making a couple of times, but found the results were O.K., but not real impressive. It takes a lot of time to go thru and get the points down (now your allowed 3500 points, I remeber when I was scolded for using almost a 1000 points, my how times change.. ;-)).

Keep trying, go over the CD-ROM.TXT, MAPS.TXT, and README.100 file for hints and tips, and good luck,

I think Keith plans on releasing 1.3.0 on monday morning. A couple of us are beta-ing it right now.

Cool new feature: the "Weather List" window- gives you quick access to all rcvd wx data.

MacAPRS 1.3.0 is now up on ftp.ucsd.edu.

Most of the new features of 1.3.0 involve weather. These include:

- * High Wind Alarm
- * High and Low Temperature Alarms
- * High DELTA TEMPERATURE Alarm

* Weather Station List. This is a window that displays ONLY stations that are weather related AND it shows all of the known weather information about each station. It also shows the last time the WEATHER information was reported.

Weather Alarms:

If you have a PEET BROS Ultimeter II, it will alarm for LOCAL alarm conditions, and it will automatically send out the WX packet immediately. It will also give you alarms if any OTHER stations report weather conditions that exceed your settings. If a station reports a condition that exceeds your alarm limits, it will be displayed as a RED circle ICON with WX in the center. (instead of the normal blue circle). If the Weather alarm condition goes away, the icon will change back to blue.

The DELTA TEMPERATURE Alarm detects the CHANGE in temperature over time. The recommended value is 10 degrees in 10 minutes. If the program sees a change in temperature that is GREATER than this, it will alarm.

Other new features...

* Dead Reckoning.

If a station reports a course and speed, the program will display (via BLUE DOTS) where the station WOULD be at the a later time. This is done on the minute, and ONLY on the currently active map window. Dead Reckoning will change/improve in the future, this is a first pass at getting this information displayed.

* Circle/Line/Triangle/Box

The PC version has supported a station type that can actually displays a shape. The Macintosh version now supports this.

- 0 - Circle
- 1 - Line
- 2 - Line
- 3 - Triangle
- 4 - Box

This is station type 'l' (Lowercase L) the information following the StaionType character describes the type/size/color of the shape.

Rendered body type: text/plain

Glad to hear that the USGS data is available on the Internet. Be sure to use the GRAphics format files. Hummh... There is no such error as ERROR-15 in QBasic????? Tell me more.

I was just using MAPFIXER last night to make a map of E. Kentucky and North PA, and had no problems. Be sure these .GRA files are from the 2,000,000 to one DLG data base.

Even if they are from a different database, as long as they are .GRA files, they should work....

When APRS asks you what FEATURE type (WB,RD,ST,etc) just hit RD for roads. Then when it asks you for the path INCLUDING THE s0#_ that means for you to include the path to the file and to include the first part of the DLG file name all the way up to the Underline character. Then MAPFIX adds the ...RD.GRF to complete the file name. For example your two responses will be RD and \Qbasic\MAPS\S06_ and that will result in MAPFIX loading the file named \QBASIC\MAPS\S06_RD.GRF

Hope that helps....

In his REPLY about USGS maps, KB8JXW correctly points out that the 100,000-1 maps are in the .OPT (optional) format. That is the reason for the CONV100.bas program written by W7KKE to convert those map files into the .GRA format used by MAPFIXER.bas. Other notes:

MAPFIXER is just a newer MAPFIX that used the finer VGA text. Use MAPFIXER from now on, unless you only have a CGA or OLD EGA PC, then you will need to stay with MAPFIX.

To RE-CAP, MAPFIXER only operates directly on .GRA formatted DLG files...

You will also need to add a RANGE to your WX alarms. You dont want CANADIAN stations tripping off the 32 degree alarm in South Florida all the time. The PC version has a settable RANGE function in its WX alarm menu. I think I had defaults of something like 128 miles for VHF and 1024 miles for HF, dont remeber exactly...

Rendered body type: text/plain

Realtime playback mode.

I am planning to make a real time demo using MacARPS by feeding a APRS log file into the computer modem port normally used by the packet TNC.

I want to used only one computer so I plan to have one port of a 4 port I/O card as the output and jumper that to the Mac modem port.

I need a 20 or 30 lines sample MacAPRS formatted log file that has position and some sample weather data.

When I use the sample log files from the IBM version of APRS and the "Open APRS data" menu command I only see DX stations plotted on the MAP. The two playback formats do not seem to be compatible.

Please E-Mail a sample MacAPRS text log file.

Thanks

Robert,

I apparently didnot get NWSPARSE.BAS with my version of APRS63B.zip, although I did see the ability to plot obsevatons. The application I am thinking of utilizes the autoforwarding and WIDE feature of APRS, but does not have to plot anything, at least initially. I am curious about just passing the NWS products intact, and having them available to many folks at once.

Will passing the entire product intact cause problems (ie channel loading, buffer/storage sizes etc.)?

Steve, here in Colorado the Denver WFO includes a series of LAT/LON locations for the weather hazard in question at the end of the statements. I was wondering 1) if all WFOs will have LAT/LON data at the end of the statements/warnings and 2) if that info can be used by the APRS software to also plot the weather hazzard in question? (This is more of a question for the APRS builders/designers)

There was a very minor bug in 1.3.0 that was due to the change in the
Position output.. This did NOT interfere with the operation of the program.

The bug was that the STATION SETTINGS DIALOG BOX would not let you change
your station settings. This has been fixed. 1.3.1 is now up on:

ftp.ucsd.edu /hamradio/packet/tcpip/incoming.

Two stations were talking about trasnmitting NWS bulletins intact in
their original VERBOSE format via APRS WIDE digipeaters. THIS cannot
work, for two reasons:

- 1) APRS only saves the latest SINGLE line per station BEACONS
and only permits a maximum of a 9 line bulletin from any one
station.
- 2) The NWS bulletins that I have seen are quite WORDY and would just
congest the network.

In our area they are transmitting the bulletins on 163.65 MHz using
straight ASCII at 1200 baud. Most TNC's can be set to ASCII mode and

receive these text bulletins directly. Why waste amateur freqs to retransmit something that is already being transmitted at several hundred watts from a great location? BUT I AM TOLD THIS IS EXPERIMENTAL. DO OTHER AREAS GET VHF NWS DATA BROADCASTS??? TOO??? If not, then how do you get these bulletins?

Not xmitted in this area (COLO). We get selected NWS bulletins off
"The Wire" and xmitt them into our ARES/RACES "Cluster Nodes"

Craig,

The AWIPS era warning generation software, used at Denver and Norman, do that and should be easily used by APRS. As AWIPS gets deployed, more offices will have that in their warnings, but AWIPS deployment will be gradual over many years.

By the way, didnt I used to see you in the background in St. Louis on TV2 with Dave Murray years ago?

This is "experimental" and is in the Wash DC area only. At 1200 baud, you must listen and store all day as the raw data come in, and then you can call software to plot the appropriate maps. A local Maryland radio store has written a

sophisticated plot package for the data, or you can get a simpler package free from NWS. Note that this means you have to tie up one radio/TNC/computer full time. The other problem is that the commercial weather services such as Accuweather and more, who make the maps for your evening TV news are kicking like mad that the gov't is giving away free data that they must pay for. (They don't pay for the data but for dedicated high speed lines & computers at the NWS.) The Weather Service will try to expand the service, but may not be allowed to in view of the opposition. A good article treating this appeared in a recent Baltimore Sun - the source of my information. I did look over the commercial software and they did do a high quality job, but it still seems to be in a beta version.

(By the way, Bob, I can hear the packets @ 163.65 but they're not making it through my TNC; are you sure it's straight ascii?)

There are a few experimental text transmissions from NWS offices in the country. Our packet transmissions here is also experimental in nature. The only official way to receive text info direct from the NWS is via a satellite downlink that costs the user \$130/month. This cost is more than many civil defense agencies can spend, so locally, we are looking for other means. I am aware of several groups in the country using ASCII transmissions, and they work well, but their range is limited. Our office covers about 125 mile radius around it. I have been kicking around ideas about how to marry the wide coverage of packet, with the direct nature of an ASCII broadcast.

There is one possibility I can think of. Our warnings contain coding that indicates the type of warning, the county affected and the expiration time. >From this a beacon message could be constructed. Any thoughts on this concept?

Thanks for all the input.

Agrello Engineering has agreed (and has already ordered) 100 XTALs on the APRS frequency of 145.79 for their 0.25 cubic inch 500 mw Two meter transmitter. I just talked to him again, and he is also willing to stock the 144.34 MHz Balloon frequency IF THERE IS ENOUGH DEMAND.

I remember 144.34 as the balloon frequency 2 years ago when we launched our last balloon.. The purpose of this message is to ask all of you out there to CONFIRM that this is a STANDARD (or maybe just POPULAR) Balloon frequency. Lemme know if you agree.

If there is enough demand, then the crystals sotcked will be
145.79 APRS
144.34 Ballooon
146.565 Fox Hunters (Im' doing this one from memory, may not be correct)

THere 800 number is 1-800-588-4300. Ooops, make that THEIR, not THERE.

I was under the impression that this data is compressed and is decompressed
on the fly by the Data Engine component of the software. I too have tried to
decode it with a TNC and had no luck. I had to fiddle with the TNC to get
some data coming through, then it was garbage. I doubt they are using any
kind of AX.25.

I feel it would be better to put the BALLOONS on 145.79 because then more
people would be able to see what is going on..

On the other hand, if the freq was too busy in an area, it might also cause
problems.. I would like to hear other peoples comments too..

I recently purchased a BAYPAC TNC and wondered if anyone has had any luck getting these to work with APRS. If so, what did you select for baud rate and TNC type (AEA, KAM, TAPR, etc)?

Sorry if this is a real silly question, but I was hoping to take an educated guess before trying a brute force attack of all the possibilities.

FORget the BAYCOM. it is NOT a TNC. it is a modem and your PC becomes the TNC through software.

APRS talks to TNC's. Sorry

The APRS programs (Both PC & Mac) Expect the data formats coming from TAPR/TNC-2 compatible TNCs. The Baycom modem only speaks KISS which APRS does not support.

I have considered doing KISS support in the Macintosh version, but due to the complexity of this and the higher priorities of other things, have not gotten to it yet..

The following comment was extracted from a msg sent to me
by a friend after he tried the APRS program on a DOS machine.

"...He's going to have to come up with better introductory
documentation before I pay that much for this program.
So it's been interesting but not very promising for me."

I can imagine how the authors feel abt documentation. It is
so-o-o-o "unproductive". The time spent writing docs cud be
put to much better use wrkg on more features in the program!

However, my friend does have a point and I thought I'd pass along
his remarks.

Comments regarding documentation:

I get comments from people saying that the problem with APRS is that
it is poorly documented. They want me to write a HOW TO document to make
it easy for a neophyte to get on line.

One of the reason that I have not done this, is because the last
thing APRS needs is another .TXT file that NO ONE will read! There are
over 2 dozen APRS readme files covering every subject. APRS is one of
the most documented programs you can find.

On the distribution disk you get README.NOW. THAT IS WHERE TO BEGIN!

README.NOW Tells you how to unzip APRS and start the program

README.1st Then provides the overall "WELCOME NEW USER" and provides
an INDEX to all of the other readme files.

APRS.DOC Provides the overall view and mission of APRS

HELP.TXT Provides detail information on EVERY one of the 120+

commands and functions in APRS.

Further files then focus on particular applications:

```
GPS.txt - For interfacing your GPS
WX.txt  - For weather reporting
DF.txt  - For Direction Finding
HF.txt  - For HF tracking
etc...etc....etc...
```

If anyone can tell me a better way (other than just adding MORE text) to get people to RTFM, I would like to know! Seriously, I have sat down several times to write a simplified summary (cookbook) for new users, but it always comes out the same.... There is just too much that needs explaining and too much background.... What I end up with is just referring to the appropriate README files, and then I have not simplified it at all, but just added more words! Someone sent me a 10 page step-by-step "press this key, then move the cursor, then press this key...." type instruction manual which was his solution. To me, it was so detailed and involved with the minutiae that in my opinion no-one would ever get all the way through it... And all it does is ADD to the README's!

If someone could tell me what they think is missing or how to present it better than the README.NOW and then README.1st scenario, then I would really like to hear it and to do it...

Please do not take this as a FLAME, if I sound frustrated, its because I have NOT been able to figure out how to make it any easier. I have had literally DOZENS of people say that they are going to re-write the DOCS into a more user friendly manual. EVERYONE of them has ultimately come back and said that after they got started, and then learned more and more of APRS capabilities, that their simplification got too complicated and they abandoned their efforts.

My last attempt at fixing this problem was to add the INDEX.txt file. All it does is say SEE README.1st! (which contains the list of all files and a one-line summary of their contents...

38. MAPS

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>

Rendered body type: text/plain

I have spent the last week breaking apart the standard APRS distro of maps into an EAST and WEST version. This is so I can provide users with more maps appropriate to their area. But this E/W distribution still only contains the maps that I have put together. They do NOT contain the very detailed MAP subsystems from OHIO, MISSOURI. And as I need more room, many of the CALIF, ALASKA and TEXAS maps will also be removed. THis weekend I finished off TEXAS to the 2,000,000 scale and so the following list shows all of the MAP systems currently available:

MAPLIST.E, W, AK, CA, MN, MO, IA, OH, TX

Following the guidelines in XTRAMAPS.txt these map sub-systems should be very easy to integrate into your system...

Here is a suggestion from a new (but successful) APRS user. All those individual files are a bit intimidating at first. To the newcommer, those file names don't mean much. Once you get going, it's not bad to look for the file you want, BUT i think it would be better to combine them into one large (manual) with the "index.txt" as the table of contents, and a first (chapter) dealing with getting started.

That first chapter should be just enough to get on line for someone who doesn't want to read the entire manual first. You could footnote it with <numbers_in_brackets> that would refer the new user to the aproprate "chapter" for more info on that topic.

Another advantage of one large DOC is you can use one of the many fine file browsing utilities like Verne Buerge's LIST to search for a particular key word. This is the way I do it.... If I want info on UNPROTO, I do a "Find" on that word, and it locates all the info there is dealing with that subject almost as fast as I can hit the keys.

I'd suspect that someone would be willing to put the files together for you, and take a first cut at making it look like a single doc. Then you could put that out to your beta testers or willing people for fine tuning and proof reading..... I've seen other packages done that way. I'd sure be willing to contribute my part.

Lance Halle KC7FVX in North Phoenix, Az

42. Documentaion for APRS

From: John Baum <jbaum@freenet.columbus.oh.us>
Date: Tue, 14 Feb 1995 21:00:57 -0500 (EST)
To: aprs sig <aprssig@tapr.org>
Message-ID: <Pine.3.07.9502142157.A26896-d101000@acme>
Rendered body type: text/plain

There is no "real" first time step by step user guide in the docs so I wrote one and posted on my BBS in the same directory where the program is located, and have "attached" it to this message.

I developed this to help others avoid the same mistake that I had, as well as the problems that others ran into on getting the program going.

Bob is right, in that writing documentaion for the program is hard. It is an ever growing and changing beast. I don't think that there is a single person out there who knows about all of the hidden treasures in the

program, (Including WB4APR).

For my own use, I printed out all the docs that I found to effect my operations and put them in a 3 ring binder (Hey Bob, how about a 70 char. wide line instead of 80 for use who print them out, this way we won't have to reformat them to keep from punching holes in text). The first thing I do when a new version arrives, is look to see what is new in the readme's, then I print out the new ones for the binders.

There is a lot of information there, and it is scattered (like PHG tables in the DF section). You would be surprised how much you can learn by just scanning the files. BUT, until the program stops evolving (fat chance) or someone steps up to either write the docs, our prints a "DUMMY'S GUIDE TO" let us muddle thru.

I think that the best idea would be to have users who are knowledgeable in the different aspects of the program, write a guide to that part of the program. Face it, we are all genius's in our own little areas, so lets share that knowledge with the rest of the world.

Hey Bob, my Maplist.MI is getting close to being done to, so that will give ya something else to worry about. Look for it toward the end of Feb.

Is there a central depository for the maps or are we still needing to contact the different Map Co-ordinators to find out where they are hiding them?

Taking some of the comments to heart about the README files, I have implemented a simple change which will be in 6.5a whenever I get it finished:

Renamed the README.NOW file to INSTALL.txt

On APRS distro disks, README.NOW was the ONLY file other than the ZIP file, so it was pretty obvious what it was. But since many folks get APRS via modem, I can see, that README.NOW did NOT stand out as the starting point among the dozens of other README files... Hope this helps...

Mmore to expect in 6.5... SPeeded up map drawing by 30% based on some suggestions by N5ZXD in Lubbock TX.

Added JUST MOBILES, JUST WEATHER to the JUST command so you can select ALL symbols of those groups vice individual symbols. DOn't forget that JUST works on the P-list also...

46. Internet Location of APRS files

Rendered body type: text/plain

Hi Bob,

Many thanks for the recent addition of the Just One changes in 65a that I had suggested and like it very much..

Just upgraded to 65a against your suggestion to hold off due to the loss of the GREEN paint can for the WIDE digi displayed stars... I picked up 64to 65A.zip from Boyds (w2hob) system but would NOT explode.. Had to get the full package.. That worked. ...

To: there must be a better way, Dept. There must be a better way for you to make changes in the CFGxxx.APR so that we can modify the ones we have WITHOUT going through the whole initialization process again as though it was a first time installation. 65A now involves many many blank lines at the bottom and that is all I could find different from CFG63.APR.....- or maybe I am not upgrading properly?

By the way Bob, watch your mailbox on Monday for a plain white envelope, there is a surprise in it.. My only regret is that it can't be put into a "file" so that it can be spread around to everyone..

73 de Rod - K2ADJ

48. Version 6.5b

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Fri, 17 Feb 1995 17:45:11 -0500 (EST)
To: aprssig@tapr.org

Rendered body type: text/plain

Well, its out. It was a major re-arrangement of maps and maplists. APRS is now distributed as an East, Central and West coast version. All versions get most all of the 64 mile CD rom maps of everywhere USA, but all smaller maps are grouped into Emaps01.zip, Cmaps01.zip and Wmaps01.zip. If you unzip one of these three unique mapfiles, then they will contain their own MAPLIST.EAS, CEN and WES that has both the USA and the regional MAPS enabled. They also contain a MAPLIST.APR that is identical to the .EAS, CEN, or WES maplist, so that when the file is unzipped, the new maplist.APR will overwrite the original one (based only on USA maps) and

you will be ready to go. If you want to zoom into maps in a different region, then you use the FILES-CHANGE MAPLIST command and temporarily load up the MAPLIST that you need. Here are the changes in the APRS65B.exe:

- * Fixed the 6.5a bug that prevented WIDE digis from showing up green
- * Added Lighthouse and Buoy symbols (the letters L and N)
- * Added Medium and really SLOW replay modes
- * Fixed Dew point probs on Manual WX reports
- * Fixed streets on a disk interface to include 2 digit SSID's
- * Turned off remaining BBEPs with BEEPS OFF comand
- * Fixed crash bug with aircraft (-7 SSID) crashing if going north!
- * MAPLIST.xxx is displayed on the CONTROL PANEL
- * HIGH res VGA text mode is saved in config file
- * New maps for TEXAS, East texas, South texas, Tulsa OKlahoma, E.KY

Got a new volunteer MAP maker in Texas (N5JXS in Houston) and N5ZXD in Lubbock.

Message-ID: <199502202123.PAA09624@Joyce-Perkins.tenet.edu>
Rendered body type: text/plain

TAPR.ORG has been relocated and has a new numeric IP address of:

204.96.214.85

DNS servers should have been updated starting yesterday.....but just in case yours is a little slow, you can use the numeric IP until things get fully updated.

The new location allows for a faster connection into Internet which should help the site in the long run.

Thanks to Lee, N5LYT, for his continued help and effort on the TAPR.ORG site.

Cheers - Greg

51. APRS6.5C fixes HSP mode

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Mon, 20 Feb 1995 18:46:14 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950220184044.22427C-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

Well after releasing 6.5b I got a call from someone having problems with HSP mode. Turns out, when I revamped the code starting with 6.5, the toggling time that APRS was looking at the GPS unit via the HSP interface was cut severely. Although it sorta worked on my system with a GPS at 9600 baud, at 4800 baud, it would only work about 10% or less of the time! Soooooooo

Version 6.5c fixes the HSP problem that has been there since 6.5. Other changes include:

Made MAPS-PLOTS such as DF and POWER plots overlay the map vice blank screen.

You can now hook-KILL on the map screen...

So, if you got 65b, but dont do HSP mode, then keep it, but do NOT further distribute it.

52. VK-trip with APRS & EYEBALL ???

Hello,

Starting on 3 MAR 95, I will be radio active in Brisbane, Queensland, Australia for a "Ham Holiday Down Under".

I will be try to be active on APRS freqs on 30 and 20 meters as VK4SID. This operation can only be a part-time effort due to the ARRL DX contest (my wife likes to contest) and some IOTA work. Some sun and fun may also get in the way of ham radio operations. Please QSL to my home call, AA8JK.

After I get back from Down Under, I will need to firm up the date for the 1995 APRS EYEBALL for this year's Dayton Hamvention. I have booked my clubhouse for both Friday and Saturday. I may be able to get a large room in the downtown area of Dayton for our EYEBALL, but I need to know which night we would want. Looking at both the clubhouse and this new location, the downtown location would fit our needs better.

Please let me know which night you think would be best. Some folks say Friday is best due to the fact many people leave Dayton after Saturday afternoon. I will need your input on this one!

We get our NWS weather bulletins via a Unix machine. One port of the Unix machine is also hooked up to our local 145.79 APRS freq. What we're trying to do is find a way to automate receiving the NWS weather bulletins, parsing the data, and then outputting the APRS formatted data via the 145.79 port on the unix machine. This needs to be totally automated and all done on the Unix machine to preclude human intervention. Any suggestions/ideas.

Thanks,
Tom

Tom,

We are doing that here in Colorado Springs. We get the weather data
via the NOAA Weather Wire Service off of satellite and run a simple
shell script program to look for headers of products we want. Once
we have one we use a simple modem program to communicate to the TNC
and send the info to our ARES packet cluster for others to view.

We will be upgrading the service to be more specific by adding
labels for routine weather or severe and extra data weather.
Presently we just send all area specific weather with the appropriate
subject lines, e.g. SPCL WX STMT de COS, TORNADO WARNG de PUB, and
so on.

If I can be of more help, let me know.

Ok, I finally got in today - FTP to edcftp.cr.usgs.gov using anonymous for login and your email address for password. Change directory to /pub/data/DLG/100k From there you will find directories A-Z. Change to the directory letter that your town starts with. Say San Antonio will be under S. Then under the S directory will be the actual towns listed. Change directory to the that town. Then you will have two more directories, hydrography and transportation. The files under those two directories will be the data. I have not tried to extract the data for use with the map making programs under APRS. If anyone has done it with these files, please let me know. For those that have telnet access, you can telnet to glis.cr.usgs.gov and get alot more detailed information.

I dont understand how the PORT on your UNIX box is "connected" to 145.79. I presume a TNC.... But what software?

Anyway, if you can make the NWS bulletins flow out of a serial port on the UNIX box, then get an old PC running my NWSPARSE.BAS program. It will scann the NWS bulletins, and build APRS OBJECTS and BEACONS automatically and send them via a TNC onto the APRS frequency. All un-attended. The NWSPARSE.bas program is distributed as source code, so you can add whatever additional bulletin parsing you need...

Well, its done! My first attempt at adding a mouse to APRS. It allows you to move the cursor and HOOK with the left button, or ZOOM with the right button on both the MAPS and the P/L lists. My implementation DOES NOT use any mouse driver, nor require a WINDOWS environment. It reads the raw data from a MICROSOFT SERIAL mouse on COM1 or COM2. (or maybe 3/4 if you are using the same interrupts). Except for the fact that APRS is now over 410K, this means you can plug a MOUSE into an old 8088 laptop, but of course it does use up a serial port. If your mouse is not MICROSOFT or does not use COM ports, then it won't work. Knocks out many nice laptops.

I did it this way for simplicity and because I am too old to figure out what a MOUSE DRIVER does and how it does it. Serial ports, like packets, I can figure out...

If you have a mouse that YOU can explain to me where I can PEEK for the X,Y values and for the button status, then send it to me. Although I dont like WINDOWS, this mouse with APRS is kinda neat...

Get APRS version 6.6...

Furthermore, there are freebie BASIC interpreters for Unix that might eliminate the old PC. On the other hand, native Unix utilities are very good at manipulating text & binary data files. There is an awfully lot to be said in favor of the link's maintainer creating the translation themselves. On the other hand it would be foolish not to study Bob's NWSPARSE.BAS to see what can be learned.

Rendered body type: text/plain

I agree, it doesnt mtter what language or what box does the NWS parsing, as long as you take the data and make APRS OBJECTS out of them. I did this because one group wanted to just spit the NWS bulletins out onto the APRS frequency (250 packet message lines)! I lookd at the four pages of bulletins and determined that all that was needed was 6 APRS OBJECTS.

- 1) was the Tropical storm location cse and speed
- 2,3,4 were the 4 8 and 12 hour forecast positions...

5,6 were APRS CIRCLE objects that marked the radius of 30 kt and 50 Kt winds.
That was it! That was also why I wanted everyone to look at the source code and try to adopt it to their circumstances. A single object on the screen is worth over 40 lines of text in this example....

Have fun. I think there is tremendous potential here....

A plea:

I sometimes run APRS in a GPS mode on an HP Palmtop, which is an 8088.
For a few hundred bucks you have a good portable computer that's smaller
than most TNC's, with full functionality if a tad slow redrawing maps. Anyway,
it's only got two megs to partition between memory & ramdisk. It can run
the full blown APRS but I worry that new bells & whistles are narrowing the
margin. I guess it's always possible to run early, smaller versions but that's
not realistically very practical. It would be nice to have a self-stripping
function
in APRS so it could slim itself down by dumping some non-vital functions
(like mouse or whatever). Or a companion "Lite" version.

Hi Bob:
Great news on version 6.6! One quick question, which I feel may benefit others, so I am posting this to the sig.. will aprs support other weather devices, specifically the Heath Weather Station? This has a standard rs-232 interface..
I am working with others in WNY state, and Southern Ontario, in conjunction with the NWS office, to use aprs to provide data to supplement voice Skywarn activity. We have quite a few units using the Heath Weather Station. There would be a sig. delay for those remotes to now attempt to convert over to the Ultimeter2, not to mention sig. costs...
73, see you at dayton, hopefully, Greg
PS Friday night sounds good, as long as it doesn't conflict with tapr...

76. Re: [APRSSIG:204] APRS Mouse!

I could add parsing of the HEATH, but it is out of production, right?
cant get it anywhere, right?

Couple that fact with the fact that most HOME WX STATIONS do NOT give a true WX picture because they are not mounted HIGH, in the clear, etc etc. Also the Heath must be interrogated, meaning that the PC running APRS must be on all the time. Many HAMS turn off their PC in sever WX conditions.

The real advantage of APRS WX nets will be the STAND-ALONE-WX unit properly located at a repeater site interfaced to a compatible TNC (PACCOM) on battery back up power. The HEATH will never be used in that situation. So in summary, I can do it, but it is WAY down on the priority list. Argue with me if I have overlooked something... hi hi

77. APRS bulletins

Rendered body type: text/plain

Since I should not and therefor cannot post a packet Bulletin announcing things such as the new MOUSE mods, i suspect that there are lots of folks out there that are NOT on the internet that would llike to know.

If you see something here that you think other packeteers in your area would like to know about, you might consider sending out a bulletin in your area.

On my local BBS, I only see a bulletin to APRS @ USA very rarely. But since people call me frequently, I know that there are APRS events going on that others might find interesting. Just got a call from a CALIF bunch that is getting 8 GPS and 8 TNC's and 8 RADIOS donated to them for some kind of Police charity event... And there are lots of balloons under construction (i think)....

I'm running APRS06c on an AT&T pc6300 with a CGA color monitor but I only get black and white. It is quite difficult to evaluate this way. Any one know where the color went? Thanks, 73 Dan W4DGE dlm@nr.infi.net

82. Video Modes

From: WMN3@aol.com
Date: Sun, 26 Feb 1995 15:00:48 -0500
To: aprssig@tapr.org
Message-ID: <950226150046_32899524@aol.com>
Rendered body type: text/plain

Hello,

I've been having a problem with all of the APRS programs. It seems that the picture is cut-off top and bottom.

By playing with my "modes" program that came with the monitor and video card, it seems that my monitor will NOT work with modes 58 and 6a.

Yes, I did check the "F7" function in APRS (ver 6.6) and that was no help.

Any suggestions, please! I'd like to demo the software for an Emergency Services group, but can't with current set-up.

Thanks, Bill aka N0NSA

Due to lack of information, I have to guess (in order of likelihood).

1. You need to adjust the vertical size knob on the monitor.
2. You are in 640x400 graphics mode instead of 640x480.
3. You have one of those cursed VGA cards (old WD or Paradise) that save their setting in NVRAM on the card and that will not return to reality until you blindly type the magic incantation. Try:
MODE C080

Mode 58 is 132x30 text and 1188x480-16 dots. None of my Trident, SMC, or Tseng 4000 manuals show a mode 6a. I don't think 58 is a suitable mode for APRS. Try mode 12.

The AT&T/Olivetti 6300 runs a CGA emulator with exactly two graphics modes. 320x200-4colors and 640x200-1color. The stock AT&T 6300 mono video will do 640x400-1color. With the DEB (display enhancement board) you can do 640x400-16colors. However, using a CGA card and monitor, 640x200-1 is the best resolution. If APRS were to run in the 320x200-4 mode, then the graphics would be disgustingly coarse.

CGA cannot do color in the HIGH RES mode. APRS only uses the HIGH-RES mode.
Sorry.

Im not familiar with "modes 58 and 6a."
APRS works with all STANDARD CGA,EGA and VGA screens. It operates 640x200
in CGA and minimum EGA systems, and uses 640x350 in normal EGA and VGA.

Rendered body type: text/plain

I got the files for a map from the edcftp.cr.usgs.gov in the 100k directory. When I tried to follow the directions is the aprs text files, it did not work at all. It seems it did not like the files. I ran the dd function on the files as suggested on the server too. Can anyone give me a step by step instruction to get a completed map? I know, I am supposed to be able to figure it out but frankly I truly don't have the time to mess with it for days at a time. Too many bills need to be paid first. Thanks for any assistance. CHris/ah6gg

2. Version 6.6

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Fri, 3 Mar 1995 17:41:05 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950303173241.10272B-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

Well, Im going to Disney world so 6.6 is here to stay, at least until mid March. So get comfortable with it. Lemme know any bugs. Known bugs that I want to fix in the next version:

- 1) the zoom prompt for mouse has the box in the wrong place in 43 line mode
- 2) Once you have a PHG, you cannot get rid of it! (always been there)

I like the mouse so much, I still hope someone has the raw data on where the mouse drivers keep the XY position and the button status. Then I can handle all mice. N2IPH sent me a complete development system for mice interfaceing, but again, it calls routines that in turn call routines that call the mouse driver. This seems like a LOT of overhead compared to the 20 lines of code that it took me to directly access the microsoft mouse. Surely this info is available somewhere...

Things in the pipeline: The MIM telemetry module
The APRS mic encoder/GPS interface
Phone-line support for dial in APRS access
Doppler Speed detectors for commuter traffic
alerts along the highway. See
TELEMETRY.txt

See ya!

3. Ultimeter II

My apologies to Bob. I meant to send this to the APRSSIG.

73,

Tom

*** Forwarding note from ROBERTST--BEN1 03/03/95 21:55 ***
To: APRS --CMSNAMES

From:
Subject: Ultimeter II
We're trying to use the ultimeter II in the stand alone mode at a remote site with the rain guage. We want to monitor the data in APRS. Everything works fine except for the rain data. The packet sent by the Ultimeter contains the rain data but APRS doesn't decode it. Again APRS only decodes the wind and temp. I have the WX authorization code for APRSand everything works fine when the Ultimeter is hooked up to the computer running APRS. Alas this doesn't help us measure the rain at remote sites. Does anyone know of a way to use the APRS/Ultimeter combo in the unattended mode at a remote site and be able to decode the rain data in APRS? Have I overlooked something or can't it be done?
Thanks,
Tom

2-15: Hi Bob de Dave, WH6YC, from enr down under. Have tailored a 6.4a disk with Australia, and did a map of area I'm visiting in Brisbane. Hope it takes off here. Just a short visit, total of 9 days inport. Wish me luck. Back to Hawaii after this, and will call you upon return. 73, Dave.

2-21: Hello again from the international dateline, junction of grid squares @J90xa, @I99xx, AJ00aa, AI09xx. We stopped for a swim call. Fun. Listening for APRS HF packets, may be copying some on 21096., but nothing else. Sure wish I could have come up on HF to xmit loc, but no amateur radio comms allowed while underway. Finally got to stringing HF wire ant at home, no copy on 10151 LSB, but heard some unk trfc on 14096.3, and made brief connect with AZ station. Upon return will re-string ant to higher up, about 50', between two coconut trees. Hope that works and maybe then will be within HF range. Also am ordering the Ultimeter II WX station for install at work, need validation number and I'll send \$14 to you ASAP. In port in a couple days, try to logon then and send this. 73, Dave.

>needs to be replaced, right?

Right. Move the update zipfile into your existing APRS directory, PKUNZIP it with the -d option and overwrite the duplicate filenames. I have found that it is sometimes a good idea NOT to let it overwrite your MAPLIST.APR file if you have customized it to encompass special maps in your area.

12. Gateway operation Questions

From: kinahan@ws007-fddi.bytex.network.com (Tom Kinahan @ws007)
Date: Mon, 6 Mar 95 12:46:21 EST
To: aprssig@tapr.org
Message-ID: <9503061746.AA27346@ws007-fddi>
Rendered body type: text/plain

I've found that I can operate a gateway with APRS and my KAM onto the local 2m APRS frequency. All the HF posits are fine, but the standard is that people

use the path ...GATE,WIDE as the standard path to get your packets onto local VHF nets. That's great.

Nobody in my area runs a WIDE digipeater (yet). My VHF range is limited.

As a result, all those gatewayed packets will only get seen by stations that see my gateway directly (not many).

Is there some way for me to get Hf posits sent to VHF via a path that will be seen? Perhaps make my mode VHF and hooking and sending HF posits as my own onto the local VHF net?

Thanks!

Anytime you upgrade either with the upgrade package or with a new full package is to use the command

```
pkunzip -dn (filename) c:\aprs
```

Then it will automatically upgrade or replace any files that are new in your APRS directory.. There is one glitch and that is the main APRS program.. The new program will be something like APRS66.EXE, here is where you will need to make some adjustment somewhere, hi.

the arguments for the PKUNZIP -dn are "d" to put files in proper sub-directories and "n" replace only the newer files from the package.

Jack, you are correct about the overwriting the MAPLIST.APR but there is a way to bring up APRS using your specially tailored maplist by using a different suffix.. Using that, when you use PKUNZIP -dn (filename)..etc. it will load in Bob Bruninga's new maplist and yours stays intact.. Then you can review his new version to see what changes have been made.

I am not sure I understand. the -dn is going to check the files and find out that the MAPLIST.APR contained in the ZIP is newer, and will then pull it out, right? Will it not then overwrite your current MAPLIST.APR?

I've had one for a couple of months and just interfaced it to APRS last week. I like it a lot - it's a good, basic weather station. I plan to get a rainfall unit for it shortly. I wish it could measure barometric pressure and relative humidity though.

I've been using the DOS version of APRS for a few weeks. I'm still not sure, however, how to do one thing which ought to be simple.

If I'm looking at another APRS station about 20 miles away, what's the command to find out bearing and distance to that station from mine? There must be such a command, but I can't figure it out. Friends say they know how, but thus far none has remembered when I asked.

Can someone please explain? Thanks in advance!

I have been using one for going on two years. I have no complaints and it
interfaces beautifully with aprs. Like others, I would love to have
barometric pressure, but that is my only reservation, and for the price,
it isn't much of a reservation at all.

Greg:

Pkunzip will see the older version and ask if you want to overwrite it. As a matter of fact, it will give you the option to overwrite anything it finds, so you don't have to go through it for each file. Good luck!

Message-ID: <950307221233_42626154@aol.com>
Rendered body type: text/plain

Using the PKUNZIP -dn arguments will overwrite your outdated files with new ones INCLUDING the maplist.xxx files..

Now, if you have a maplist that is tailored by yourself and you do not want it to be over written by new files, then rename the maplist.xxx to something like maplist.adj, using the last three letters of your callsign (adj being mine). Then when you use the PKUNZIP -dn it will not overwrite your tailored copy.. You can look at the new ones along with the new maps in the package and update your maplist.. Now, another thing, in the config##.apr file, the 3rd line is the name of the maplist, you want to change that so it is YOUR maplist that you want to run.

On my system I take the maplist.eas and rename it maplist.adj, in my config.apr file, I call upon maplist.adj when booting up so that the right maplist is called upon.

Now, when I upgrade, I don't loose any work that I have done and end up with the latest info from Bob.

Hope that this answers our question. 73 de Rod

Maybe you your idea of inexpensive is different than mine. But then it's a matter of how much bang you want for your buck. The wx instrumnets are pretty much standard equipment, the wall mount has enough features to act as a good standalone unit, I didn't think much of the optional software, and it interfaces with APRS - what else could a ham want.

The low end Garmins seem to work real well, the GPS-45 is a very good unit. Price is around \$399.00 (But shop around for best price.) I have been using the GPS-50 (no longer made) and a couple others around here are using the GPS-75. We have had no problem with them while in use as APRS standalone trackers.

Other units include the Magelan Meridians. New units do include the RMC string, but I understand they can sent to the factory and reprogrammed with the RMC string. (RMC is the string put out by the GPS and includes course, speed, & bearing).

One point on the marine Garmin, they quit working above 90 knots, so if plan to use them areomobile, these won't work.

Hope this helps,

73

One of my friends purchased one three days ago at E&B in Darien, CT. I would be quite surprised to find the offer suddenly withdrawn. E&B is a supplier of boating accessories; this is the time one would expect such toys to be in large supply in view of the upcoming boating season.

They may have an 800 number too. Locally its 617-933-3290. I bought a
power/data cable there yesterday for my gps45, and they were listed in
the display case at \$299, which means if you find a better deal they'll
match it. For 800 Info, dial 18005551212. 73

> What is DLG, how much does it cost, and where do you get it?
> Also, how detailed are the maps?

There's some information on DLG CDROM's in \APRS\README\CDROM.TXT.
Here's a bit more.

DLG is Digital Line Graph data. What you want is:
1:100,000-Scale DLG Hydrography and Transportation
US GeoData OPTIONAL FORMAT. Make sure you order the Optional format.
The easiest way to order is from the USGS at 1-800-USA-MAPS. \$35?
Mine is dated May 1993.

There are 14 areas available.

1. Northeastern States
2. Middle Atlantic States
3. Southeastern States
4. Florida
5. Southern Mississippi Valley States.
6. Central Mississippi Valley States.
7. Northern Great Lakes States.
8. Texas and Oklahoma
9. Central Plains States.
10. Northern Plains States.
11. Arizona and New Mexico
12. Central Pacific States.
13. Northwestern States.
14. Hawaiian Islands.

You will need to know the area number before ordering as the order taker sometimes has no clue. If you need help identifying which state goes with which map, please send email.

Each CDRom contains maps which are divided into layers and quads (quadrants).
The layers are:

- hydrography (rivers, lakes and streams).
- misc transportation.
- railroads.
- roads.

Each quadrant is further divided into 15 minute cells. In extremely detailed areas, the map is further divided into 7.5 minute cells. A dump of everything in a typical 15 minute cell generates 4MB of data. Some discretion is advised or your hard disk will rapidly fill. I suggest that one reads the "Getting Started" on the DLG CDRom before attacking as the user interface is a bit bizarre. There is also a users guide (in ascii and wp5.1 format) on the CDRom explaining usage and file formats.

One big catch. There are no map labels. No city names, no streets, and no river names. There are also no landmarks (mountain tops). These will all need to be added by hand.

I hope this helps.

To use the DLG 1:100,000 you need LOTS of memory.. 20meg is a good place to
START. 28 meg is better.. Yes, it is a MEMORY HOG.. But it is FAST... I did
not expect the 'faint-at-heart' to do this much, and the memory intensive way
was MUCH less painfull than the alternatives...

Give me a call and I will try to help you through it..

Fortunately, most of the PowerBooks have two serial ports, however, this is a
problem that has been solved very nicely by Paccomm's new PicoPacket.

The Pico Packet is a TNC that has an optional GPS unit available for it. When
configured in this mode, you can talk to both the TNC and the GPS through the
same serial port. This unit will be available by Dayton, and will solve a
lot of the mobile problems for both Macs and PCs..

Digipeat paths are set by the originators. That means that all HFers that go via GATE,WIDE (the standard) will only go via a TNC with the alias of WIDE after passing through the gate. All you need to do is get someone with a good antenna to set his alias to WIDE and leave his TNC on the air. All HF gatewayed packets will then be digipeated by him.

Hello Tom. You can run aprs in a window under os/2 by doing the following:
Set your video mode to cga only. This will allow aprs to run in a window,
but it will not have color. Then when you start up aprs, click on the upper
left block and pick scaled image. Like I said, it will not be in color, but
it will multitask.

I run it just fine using a normal dos box and not setting the parms to CGA.
I usually run it in a full screen mode, but I just use ctrl-home to bring
it to presentation manager. I can see me APRS in one screen, and my packet
on another (different com port).

Works great (currently using warp)

Cheers...mike mwalker@interlog.com

64. PK-12 in HSP mode

I have found a bug (oh no!) in the PK-12 software. It seems that when you are using a PK-12 in standalone mode (not in HSP mode like I said in the comment line), that the GLL data is not separated from the VTG data.

According to Bob, there must be a CR/LF between the two data streams.

I have made AEA aware of this and as soon as the programmer gets off the current project, he will make the correct changes to the EPROM.

Please do not bug (oh no!) AEA about this unless you are experiencing the problem. (IE: you are running with a GPS in standalone mode)

I'll let you know when the fix is available.

Cheers...mike

Rendered body type: text/plain

Concerning the GPS units that plug into a PCMCIA card slot. Be cautious, I do NOT know how PCMCIA cards work. APRS can ONLY operate with a GPS unit operating via a standard COM1 or COM2. If the PCMCIA GPS card can be made to LOOK like a COM port, then it should work. Otherwise it will NOT work with APRS... (unless someone can tell me how to do it....)

75. PK-12 in STAND ALONE MODE

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Tue, 14 Mar 1995 09:22:15 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950314091721.2304E@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

To reiterate the earlier message about the GLL/VTG bug in the PK-12, it ONLY affects STAND ALONE MODE, and it will only be noticed if your GPS DOES NOT OUTPUT the RMC sentence. In otherwords, the RMC sentence

includes both position, course and speed in ONE packet, whereas some GPS units and ALL LORANS only have the GLL and separate VTG sentence.

If you are using STAND ALONE mode AND you are using GLL and VTG, then you have a problem, in that the VTG will NOT be seen by APRS, since it is not separated by the PK-12 with a CR/LF.

The reason they didnt catch it, of course, is that most GPS units output RMC and that is much better to use (only 1 packet vice 2)...

76. Re: [APRSSIG:284] Gateway functions

Rendered body type: text/plain

Operating your station as a HF to VHF gateway HAS NOTHING TO DO WITH APRS. It is purely a TNC function. The TNC will gateway without even being connected to a PC or APRS. SO just set up your TNC to gateway packets addressed via GATE to be gatewayed by your station. In the KAM, all you have to do is to set MYgate to GATE and set GATEWAY ON...

77. Re: [APRSSIG:287] Re: GPS Rec...

Rendered body type: text/plain

Regarding sharing a COM port with the MAC. Check with KEITH SPROUL who wrote the program. The HSP (hardware single port mode) switch circuit that lets the GPS and TNC share the same COM port requires APRS to do the switching using HARDWARE handshaking lines. Unless the MACaprs ALSO has included this software code, then the HSP switch will NOT work. Lets see what Keith says....

78. APRS via SAREX!

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Tue, 14 Mar 1995 09:47:17 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950314093320.2304H-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

I left my APRS on the SAREX freq overnight and picked up 3 BEACONS digipeated by the shuttle! This means that Ron Parise has turned on the DIGI for UI frames ONLY. (I read this to mean APRS is fair game for the remainder of the mission when the PACKET is on the air). To use APRS as an excellent tool for SAREX, please consider the following:

- 1) Receive on 145.55. Transmit split on 144.49. DO NOT XMT on 55!!!!
- 2) Set APRS to GRIDSQUARE mode (alt-G or alt-S-MODES-GRIDSQ for v6.6)
- 3) Do NOT send any MSGS or BLTNS
- 4) During a pass hit the X key to force a POSIT report
- 5) Use alt-B to change your BText to something like SAREX test... (remember, the shorter the better. Maybe even none...)
- 6) READ the SPACE.TXT file!

APRS users will actually be sending fewer packets than ALL other stations that are trying to connect to SAREX, and as long as ou DO NOT transmit on 55, this should be a good gentlemenly experiment. Good luck!

79. LORAN

Rendered body type: text/plain

I visited the local boat store, BOAT US, and they have the Magellan Meridian for about \$283 but I had heard that the GARMIN 45 was being sold at a regular price of \$299. I would get the GARMIN UNLESS you will ever take it FLYING (it stops working at 90 kts)...

What caught my eye was the \$139 clearance price on INTERPHASE PILOT-2 LORANS. This unit only draws 50 MA! (all GPS units that I have seen are from 180 to 250 MA). I almost baught one, just to put on the wife's car, but then I already have GPS for that and finally talked myself out of it,

since you should be able to get used LORANS from just about anyone for \$25...

BUT, If you want to make a LOW power stand alone tracker and can put up with a 50 inch or longer whip antenna, then this is the cheap way to go. A balloon could use just a slim piece of wire for the antenna, so this might be an attractive way to go... The device has NMEA outputs of GLL and VTG of course....

>I just joined this list and came in late on the topographic maps on CD ROM >discussion. Which one is best and where do you get it?

My original comment about the RAM was ment to go to an individual, not the entire group, but thats what happens when you get spoiled by your mail system.

To CREATE the high-res maps on the Macintosh, (FROM THE 1:100,000 scale CDs) you need at least 20 meg of RAM for the program.

!!!!HOWEVER!!!! This ONLY to CREATE the map files, NOT to use them. Any one with the program and even just a 6 meg or so can run these maps just fine.

My brother, (KB2ICI) also does a lot of stuff with imaging, he has about 300 NASA CD-ROMs, and also writes color image software for the Associated Press has 90meg in one of his main machines and 76meg in the other.

We both have 28meg in our Macintosh PowerBook 540Cs...

The capability to create the 1:100,000 scale maps has not been released in the Mac version yet due to a math conversion problem which I have not had time to get back to to fix. The maps genneraly run .1 mile off when converting the UTM coordinates to Lat/Lon. When I get this fixed, I will release this capability too.

The map interace for this is a really cool point, double-click and check a few check boxes, it then creates the maps 1-2-3!!! Really slick..

This is the interface stuff I am going to be implenting sometime this summer to allow the MacAPRS to create PC map files. I am going to work on significant amounts of data reduction, line-joining algorythms and the like to allow the maps files to get down to the 3000 point limitations..

Uh, can anyone expand on the used LORANs for \$25 theme? I tuned across a teevee pgm the other day discussing what it takes to upgrade LORAN sets in the NE atlantic region. They didn't say but I suspect the reason for the upgrade was due to a change in master stations. Anyway, they were quoting around \$200 for an eeprom upgrade and general checkout on the bench.

The question that came to my mind was: Are LORAN sets programmed for specific regions, or can they be used anywhere?

The PicoPacket basic unit (1200 baud TNC) is \$129.
If you want 128k RAM, the price is \$149.

To use the Pico with an external GPS, order the GPS port option, which includes 128k RAM, Real Time Clock, and 2nd serial port. About \$50 (haven't decided yet.)

The PicoPacket can be ordered with a slide-on/slide-off battery pack. This must be factory installed (different case). About \$50.

The PicoPacket may be ordered with an internal Garmin-20 GPS receiver. This includes the second serial port, more RAM, etc. This also requires the external battery pack, i.e. the GPS model requires all the other options. Price not settled, but should be around \$600. (Our TINY-2 with built-in Trimble GPS goes for \$675.)

The basic PicoPacket should be ready in a few weeks, certainly by Dayton. Whether the battery pack will be available by then is unsure. Waiting on a new cabinet extrusion...

90. Different GPS Receivers

From: paul@paccomm.com
Date: Wed, 15 Mar 95 08:27:06 UTC
To: aprssig@tapr.org
Message-ID: <1379@paccomm.com>

Rendered body type: text/plain

(The views expressed here are not necessarily those of PacComm)

Hi. I get a lot of calls every day about GPS receivers. My short conclusions are as follows:

Magellan consumer GPS: Don't touch them. I know many go back to the factory for repair and they are also flaky with crashes, etc. The battery pack on the Meridian is particularly crummy.....

The price is \$287 right now at West Marine.

Garmin: These are reliable, cheap and out-selling everything else 10:1

I have one and cannot find any fault with it. The price is now \$298 every day at E&B, West Marine, etc. Maybe some of the distance calculations are a little suspect between waypoints (I'm testing that on my Catalina 36 sailboat "Spindrift" and I'm testing it against insatlled LORAN).

The Garmin 20 OEM is under test at PacComm against the Trimble OEM.

I now have a program I wrote yesterday which will compare the output fixes between two side-by-side receivers. The results are VERY interesting!!!!!!

Ray Jefferson: Well, won't even comment about these.....

Trimble: expensive well built unit, getting massively out sold by the competition.

Finally. The OEM modules might appear expensive against consumer units but I'm convinced more and more that they give better tracking results and, of course, they integrate easily into such things as TNCs.

Regards, Paul W4/G4BKI

GPS mode, best I can explain, picks a particular data stream from the
GPS with a connection from the NMEA-0183 output (most popular, I know
nothing about the other standard) and serial input to the TNC. The TNC
puts it in a beacon and transmits it based on the settings of a couple
TNC commands specific to the GPS mode (ie, which data stream to use, how
often to transmit it, how often to beacon, ...etc).

>Additionally, what is the difference between NMEA 0180 and 0183? I was

98. PacComm PicoPacket (Chip Griffin, N1MIE)

From: gwyn@paccomm.com (Gwyn Reedy, W1BEL)
Date: Thu, 16 Mar 95 06:38:22 UTC
To: emmet2@aol.com
Cc: cc
Message-ID: <1415@paccomm.com>
Rendered body type: text/plain

The PicoPacket is available in several flavors:

- The standard model has 32k RAM and requires an external power source. It will operate from as low as 5-6 volts, so a 9v battery works just fine. This model has one serial port just like any other TNC and this port supports a GPS using the same firmware features as our existing TNCs.
- The standard model is available with 128k RAM for \$149. The user may install the larger RAM chip if desired and when desired.
- The standard model may be equipped with a full time second serial port for attachment to a GPS. This option board comes with a real time clock, 128k RAM, and the serial port hardware. This option will be priced about \$50.
- You may order the PicoPacket Battery Pack model. A different case back and end panels are used to accommodate a slide-on/off battery pack (like a cellular phone). This is not user installable due to the different case pieces. The battery pack model may also support the GPS port option if desired. Expected price on the battery pack model is \$179 (tentative).
- You may order a PicoPacket with a Garmin-20 GPS built into the same case. This is a special version of the battery pack model so the battery pack, clock, 128k RAM, second serial port, etc. are all included. The serial port is hardwired to the GPS, of course. Expected price on this is about \$600-650.

With the internal GPS or the second serial port option, firmware commands will allow the attached PC to talk 'through' the TNC to the GPS to give setup instructions and to read GPS output directly. This will eliminate the need for any hardware devices to fit a TNC and GPS onto the single serial port of a laptop computer. It will also eliminate any hardware dependence on the control lines of the computer serial port which should simplify interfacing to a variety of portables, including Macintoshes.

Availability? The standard model is likely to be in full production early in April, certainly by Dayton. The second serial port option, battery pack model, etc. may or may not be available by Dayton. We're moving as fast as we can, consistent with upholding quality.

Rendered body type: text/plain

I tried it again last night (in a hurray) and the display shimmered and the system hung (I have an intermittent hardware problem that I haven't found yet).

But, the last time I tried it the screen resized normally and I also had KAGOLD running in another window. I might have had EGA mode for APRS turned on (F7). I am using a default DOS setting, APRS V6.6 (it might have been 6.4 when I last tried it), and SIO on the com ports.

I'll look more closely at it over the weekend.
regards...mike

Can somebody tell me what we need out here (in No IL) to put up an unmanned, remote WX reporting station. Primarily we need info on TNC's that will take U-II data and beacon it out without computers. We sold the NWS/Romeoville (Chicago) and Multi-County Severe Storm Warning System people on APRS as an excellent SKYWARN asset. And we strongly hinted that an unmanned WX site could be bought cheap. Now they want figures. HELP!

>Has anyone had any luck getting APRS to run in a window on the OS/2 desktop. Mine works fine full screen but when I try to run it as a window I get the message that "the video mode is not supported."

You may get it to run if you are set to no more than 640x480x16 colors on the desktop. One other thing you should be aware of, even if you can get it to run in a full screen session, chances are, it stops running when you put it in the background. I played with it for months using both 2.11 and Warp with no ultimate resolution and was told by IBM Tech Support that it won't work unless the application video support (APRS) was better behaved.

In general, DOS graphics programs will not run in an OS/2 dos window unless you set your desktop to 640x480x16, and even then it is iffy.

This discussion went on for months on the os2dos echo of fidonet and the conclusion presented here is the result. I now run APRS on a dedicated 16 Mhz AT.

3-6: Hi Bob, just finished meeting with Patrick VK4TAB, and James VK4TOY, of Brisbane. Previewed APRS with them, and they seemed very excited. They will share the disks and work on an APRS net on 144.85. Freq is shared w/a BBS, but load in minimal so it should support an active APRS net. Good local area coverage as well. They should be in contact with you shortly, hopefully to validate their call signs. They had not previously heard of APRS, but think there is great use for it here down under. I saw the local distributor's ad for the Ultimeter II wx station, and they mention APRS. I was going to suggest they build that as a marketing tool, but looks like somebody beat me to it. BTW, local guys here wondering how hard it would be to have a European version with kilometers vs statute miles, etc. Will be back in San Diego in April/May. Should get a chance to check up on their APRS efforts. I'm curious how many recent validation requests you've received, besides KI6MP. Can your val. db search on San Diego area, and let me know just call signs. I gave out about 15-20 disks there with all the CA maps that W7KKE has done. Also helped KI6MP set up HF-VHF gate, and we watched Ken driving home one afternoon. All for this msg, hope to hear back from you via email. This is much better way for me to keep in touch. Beats packet bbs (unfortunately). Also, many packet BBSs in AUS are pw protected, so I couldn't even logon. I think we'll see a decrease in packet BBS activity as email and internet catch on. One more request. I've ordered the Ultimeter II WX station, and would like a WX station validation number. I'll get the check for \$14 off to you. Would you please send the number to my email address. Thanks.

3-17: Back in Brisbane, and talked with my wife, Diana, last night. She told me you had called. I'll call you when I get back, or you can reply here via email. Regards, Dave.

We are using the Paccomm Tiny-2 MK-2 TNC with the Ultimeter weather station here. Everything works just fine. The Ultimeter sells for around \$179 and the Tiny-2 for around \$129. The only problem we're having is getting the rain gauge (\$\$ option) data transmitted by the stand alone weather station to be properly decoded by APRS. Temp, wind speed, and direction all work fine. I know that Paccomm has a new TNC coming out that supports the Ultimeter and I believe that the KAM KPC-3 also supports it.

<<You may get it to run if you are set to no more than 640x480x16 <<

As was mentioned earlier you can get it to run in a window if you set the video mode to CGA. I tried this and it does work fine although you only get black and white. Someone else posted a message saying that they were running APRS in a window in color without the program being suspended. He is going to reconfirm this and let us know. By the way I posted the original message.

Rendered body type: text/plain

Hi Bob , Keith and all,

Greetings from the Chicago Metro area.

We now have 10-15 stations active on a regular basis in the area with a bunch more dropping in on the weekends. I've got a dedicated digi up in downtown Chicago running 25 W at 600 ft agl using a 10 db gain beam pointed west and it seems to be working out well. If ur in the metro area set your path to relay, wide and we should see you.

It seems that Dan, N9XHP, Dave, KA9NHL and I are presenting APRS on a weekly basis to someone, we have hit most of the major Radio Clubs in area and are fast becoming a feature at local hamfests. Both the local CAP and now the USCG aux are watching with interest and have in fact started buying equipment and getting members to become hams. This spinoff from program is something we haven't thought much about but with the dedicated, knowledgeable people we have seen enter the hobby this way it may be a great way to increase our numbers.

By the way Bob, in the map help files on APRS you have my name and Dave's, KA9NHL, call listed as IL map co-ord. It looks like we have found an Illinois map maker and hopefully we will have some new maps soon.

We have sent off copies of program to the Greenville NC area but the fellow can't find any activity, anyone know if the one on air yet and if so what freq?

I'll be traveling to Lake of the Ozarks for the week of 6-13 April and will be beaconing on 145.79. Route will be via Springfield IL, St. Louis, Jefferson City MO to Lake Ozark Beach. What freq are you guys in MO using?

All for now CUL

Hi All:

I run the Bob's APRS for PC version 6.6. I leave my APRS station running while I'm at work, but my xyl complains that the constant beeping is annoying her. She keeps wondering if an alarm is going off or if some piece of equipment is frying.

I used the alt-S - Other - B commands to turn off beeping, but it persists in some cases anyway.

Any way to completely mute the program? (Other than disconnecting the speaker or adding an outboard speaker-line switch).

Jess

Hi. Several people have been asking about this on the SIG. Due to problems at this end resolving addresses, I failed to respond to them individually so have had to resort to using the WHOLE SIG. Please don't take this as an advert! I have written an application note on using the ULTIMETER-II with our TNCs, including wiring details and EXACTLY what to do in setting up BTEXT, GPS functions

(YES they ARE used to do this!), etc. If you need further info please call PacComm and ask for me and I will fax or send you (with a catalog) the application note. Please indicate that you heard about it from the APRSSIG. Tnx.

The problem with a remote U-II RAIN GAUGE is that the U-II only reports the current value of a continuously running rain counter. The rain value is useless unless you know what it was an hour ago, a day ago or a week ago, etc.,, APRS automatically subtracts off the previous value for a rain gauge connected to a U-II connected locally. But for these remote WX indicators everyone will have a different count.

Therefore, I didnt even include the remote WX RAIN data from a standalone U-II rain gauge. I have since modified the code in 6.7 (not yet released) that will report the rain from a remote U-II as just the RAW count with a lower case /rxxxx vice the /Rxx for the rain per hour...

Rendered body type: text/plain

Just to finish out the week, I thought I would share the latest excitement.

First, the good news... I reduced the size of the program by 20K

The BAD news: I filled it back up by adding 3D display!!!

The 3D display projects the MAP onto the bottom 1/6th of the screen with the horizon about 1/3 up. This makes all aircraft rise above the map and show altitude. All cursor and zoom functions still function!

This is a 3D display of station/object altitude... It DOES NOT produce 3D Terrain data.

Version 6.7 should be available some time toward the end of March...

114. MAPFIXER from 6.6

From: stewart@kepler.IFA.Hawaii.Edu (Christopher Stewart)
Date: Fri, 17 Mar 95 14:55:11 HST
To: aprssig@tapr.org
Message-ID: <9503180055.AA06483@kepler.ifa.hawaii.edu>
Rendered body type: text/plain

Well, after many many frustrating hours on trying to get a map made with this program (Remember, I have not seen this work ever so is all new to me) I finally figured out what the problem is. The MAPFIXER program itself from version 6.6 has bugs. When I do the exact same thing with version 6.2 of MAPFIX it works fine. Talk about being bummed. All that time wasted when I could have used an older version that works. Hope this helps somebody. Now that I actually have a map, am now impressed with the possibilities. Chris/ah6gg

115. Re: [APRSSIG:333] MAPFIXER from 6.6

I believe that the mapfixer has been fixed..on the latest version. I wonder if anyone is using a compiled version of mapfixer? Ive been quite successful compiling the mapfixer.bas and using the mapfixer.exe for my map conversions...works slick.

another problem however..living in Boston (the land of curving streets) I have found that conv100b. only goes to 5000 lines of data..thus I am losing streets from the 1:100,000 cdrom data...Does anyone have any experience or is it even possible to increase the number of lines processed.??...Anxious to know...Jim W1KRU (I started with version 1.08)

Hello Paul - Here's another GPS unit to wonder about - I'm using the Eagle AccuNav Sport. It has a Rockwell engine in it, and sold for \$498 just before Christmas. - Eagle/Lorwance is well know for their fish/depth locators, and designed this unit for marine applications. I chose it, not because of the cost of the basic unit, but because of the cost of the accessories. The add on's were 1/4 that of others (External Ants, mounting brackets etc) and it is capable of UL/DL waypoint info from a PC.

I am pretty sure that it uses the NavCore V engine - with quick Time to First Fix. It's a 5 channel receiver with all in view. The only major drawback is that it uses a passive ant, which could be a bear in the urban areas. The only problem I've had has been that the ant is a bear to take off and put on.

Now then for my question, have you had a chance to look at any Receivers that use the Rockwell receivers, and if so, how do they stack up? (I know - grumble grumble grumble, another critic heard from...).

BTW - Thanks to all you nice folks at PacComm for the support you've

given us APRS'ers.

Thank gawd it doesn't produce 3D Terrain data. - Some of us map makers have a hard enuf time drawing in 2D. (Sometimes my wife accused me of being in the 4th D when I'm heavy into mapping, but that's another story).

Coming at the end of March - MIMAPS01.zip - aka - the lower 1/3 of that state North of Ohio from Lake Mi to Lake Erie & Lake St Clair - Including Detroit.

" Any way to completely mute the program? (Other than disconnecting the speaker or adding an outboard speaker-line switch).

"

" Jess

" ndll

"

We share a freq with 1 bbs and some tcp/ip-like stuff, which occasionally goes off like a pinball machine. I don't remember specifically if one can shut off all the aprs alarms/bells, however. You might look at other users of the freq, and see if they're sending lots of ^Gs or simialr noisemakers.

119. Question Concerning SKYWARN ops

From: "Ruston S. Baum" <rsb@crl.com>

Date: Sat, 18 Mar 1995 11:28:23 -0800 (PST)

To: aprssig@tapr.org

Message-ID: <Pine.SUN.3.91.950318112055.8015B-100000@crl8.crl.com>

Rendered body type: text/plain

I am revising some packet software used at our NWS office here in St. Louis. Was wondering if anyone has experience using APRS during SKYWARN operations. Is it easy for new-comers to get up to speed using APRS? Presently we are using ARESPACK 3.0 as one of our incoming message systems. We love to hear any thoughts or comments.

Thanks very much.....

I dunno, Bob. I'm typing this in one room with v.6.6 running in another. The beeps keep coming as I type. I'll try to figure out whether they're embedded in beacon strings or whether the program is creating them. It's kind of hard to tell (for me, anyway, maybe I'm still too new at it...)

Hi John:

There isn't much on .79 around here except for APRS users. I'm hearing too many beeps (right this minute, in fact) to believe that they're coming from other than APRS stations. Maybe they are embedded ctrl-g's as Bob suggested. I'll keep trying to figure it out.

Hi Rusty:

Getting APRS up and running, using Ultimeter II(s), has beeneasy to get going here in WNY.

When I started with VHF APRS,there was one Canadian and myself on frequency. APRS has caught on since!

You can talk to Judy Levin, N2TEZ, who's our head NWS contact here in Buffalo, NY.

They have justed started the move into a new facility, which will have 3 VHF units, one of which is dedicated to APRS...

The automated weather data is sure a nice supplement to the voice Skywarn system!

> Someone else posted a message saying
that they were running APRS in a window in color without the
program being suspended. He is going to reconfirm this and let us
know. By the way I posted the original message.

Hi Tom...yes I have been thought the wars with this one and any other graphics
program (dos) under os/2 since version 2.10 and through warp fullpak. There
have been isolated (very) reports of being able to run in more than 16 colors
in a window, but they have been few and far between and not reproducible
<bummer>. A larger number of people have been able to get aprs to run in 16
colors in a window at 640x480, but not everyone. I think your solution is the
first one I have seen that claims to work nearly all the time. I assume you
are going into your dos settings for the app and setting cga only?

I now run aprs on a dedicated 16mhz AT, so it is more of technical interest to
me than anything else. Let me know how things turn out. I am a very big fan
of OS/2, in fact I just upgraded my best machine to an AMD DX2/100 and with 16M
of ram and a VL-Bus video card it screams.

I made a logic error by neglecting to use the word "not" after "they're" in
the 2nd sentence above. Sorry. I meant that the beeps are indeed coming
from APRS stations.

Listening again this morning I found many, many frames coming from APRS
stations that cause my system to beep even though "beeps" is turned off. I
began compiling a list of stations but then found that sometimes they
beeped and other times they were silent. It's hard to believe that the
same APRS position string could have a ctrl-g embedded sometimes and other
times not. How do you save incoming frames to a file? That way I can use
an editor to look for ctrl-g's.

Meanwhile I think I'll just put an on/off switch in the speaker line.

126. APRS maps from CDROMs

From: N9VJQ@aol.com
Date: Sun, 19 Mar 1995 12:32:04 -0500
To: aprssig@tapr.org
Message-ID: <950319123202_54152251@aol.com>
Rendered body type: text/plain

Hi,

I'm trying to make maps from USGS 2000000:1 CDROM.

Please tell me what I'm doing wrong:

Brought up the map i'm interested in.

Got the center of interest (lat/long), ppp (900), and L/L of the map's
origin.

Backed out of MAPFIXER and then came back in; loaded NEW

Put origin of other map (45,26 Lat, 92,76 Long in Deg,Min)

Put PPD of 900

Got blank map with origin where I wanted it, range what I specified.

Went to center of interest (41.9088 Lat/ 88.7529 Long)

Hit ALT-U; Entered origin, type of USGS map (RD), entered with 100% extent

L/L (I really dont know what that means, and can't find it in the CDRom readme).

Then it asks me for the exact path for the program to find the "S??" file. I typed it all in and hit enter, and nothing happens.

Now when I got the USGS 2,000,000:1 CDRom, I went to "Xtract", chose "Optional", and got files called "S06_RD.LG0", for roads. However, when I try to get MAPFIXER to take the CDRom map again, when I get to the part to input the RD, or whatever type it is, it puts a ".GRF" extension on the file.

Also, I've got a borrowed SummaSketch II w/16 button cursor which I can't get to work with MAPFIXER as a digitizer, or APRS as a mouse. On MAPFIXER, it gives me a "buffer overflow" message. The closest I can get it to the "XXXX,YYYY,Apn" is an ASCII "XXXX.xx, YYYY.yy,AA,B".

HELP!!!

Thanks

127. APRS 6.6, & TXBEXAR map

From: lgenco@crl.com (Lou Genco)

Date: Sun, 19 Mar 1995 11:34:02 -0600

To: aprssig@tapr.org

Message-ID: <Ai6RlWpGkH0B075yn@crl.com>

Rendered body type: text/plain

Bob -

Good to see you on Internet, lots easier to send email than to write snailmail notes.

I Just upgraded to APRS 6.6, and noted what might be a problem or two:

1) When viewing the Positions or Latest Beacons screens, one or more of the lines seems to jump up and overwrite a previous entry. Almost as if the line contained ANSI char sequences to move up a line. This messes up the sequence when trying to Hook a station from the text page (the hooked station is different than that shown by the little circular cursor).

2) For a short while after loading APRS, the map display disappears at irregular intervals. The info box at the top right returns, but the map stays blanked until <spacebar> or <1> is bashed.

In the recent MAPLIST.USA, you asked who had TXBEXAR.MAP. I guess I am guilty of making that one. It was my first attempt at crunching some data I received from USGS. It is only about 1400 lines long, so I can send it to you by email if you wish (or does tapr.org have an inbound FTP area?). Alternately, I can put it on -my- www / ftp site, and let you download it at your leisure.

Finally, since you are now on Internet, a small plug for one of my Internet contributions. If you are interested in nostalgic radio programs, and would like a FAQ (list of frequently asked questions and answers) with info on what Internet has to offer for this hobby, there is a FTP-by-mail server that will automagically send you a copy of the latest OTR FAQ. To receive a FAQ, send email in -exactly- this format (the case of the file name IS important):

To: lgenco@crl.com

Subject: Request otr.faq

(the body of the message is ignored)

Jess,

If someone has a ctrl-g in their beacon but not their location text then maybe this would explain why the same station beeps sometimes and not beep other times.

Just a thought.

Kent

Hi Kent:

The very same string sometimes beeps, sometimes not. I was trying to correlate beeping to digipeating by WIDE which of course is not a single station. It may be I'm actually seeing such a correlation, but again without a way to save these observed strings to disk I can't say what I'm looking at. If I can save them to disk I'll be able to examine the actual hex digits for received characters. Maybe I'll just use procomm+ and save to a file whatever I receive for 20 minutes and go hunting for ctrl-g's... if I find any.

Hi Bob, boys and I were all over the world last night on TCP/IP radio connect to interlink, incl good connect into Moscow, Germany and Nevada. Wow. Tried HI no luck, nor with KA6EYH in SFO. Anyhow, I've remembered what other word I wanted to pass to you. The TX maps of Lajita and Gdflw are unused maps. Would you please delete them from MAPLIST.APR. I don't think either of the maps are in the MAPS directory. Also pls change all ref from KB5UBW to WH6YC. Really enjoying visit with VK4TAB/VK4TOY. TAB and I will be APRS/GPS mobile in a couple days, to do local map. He's already come up with a good area map of SE Queensland, using a Kurta graphics tablet. More later. Looks like I'm flying back to HI on Wednesday 23rd. Regards, Dave.

I can successfully run APRS in a PM window. The solution is I run in 16 colour mode. The reason I run in 16 colour mode is I am using an ATI Wonder 28800 chipset and OS/2 wont run in SVGA mode with that display and when you have more than 2 com ports (I have 4 full time ports).

As I result, I have APAR PJ16459 opened and I am waiting for a PTF from IBM (I suspect it is going to be faster to buy a new SVGA card). You may have the problem if you are running SVGA.

I hope this helps...mike

To: aprssig@tapr.org
Message-ID: <372B6D2F0149BFD1@-SMF->
Rendered body type: text/plain

Form: Memo
Text: (18 lines follow)
Hi All,

I've been experimenting with APRS along with some friends here in the High Desert of Southern California. So far I have only seen APRS traffic outside of our group one time on 145.010. I've been scanning the packet frequencies but I haven't come across any other systems. Is there a particular frequency for APRS activity in Southern or Central California? I'm located in Tehachapi at an elevation of 4000 feet so I have pretty good coverage into the High Desert area to the East and well into Central California to the North and West. I've tried the VHF APRS net frequency mentioned in the documentation (145.950 if I remember correctly) and I have heard some distant traffic on occasion but it was too weak for my TNC to lock onto.

Any assistance would be appreciated.

ANSWER: APRS will automatically save everything. The only time you have to manually save is RIGHT BEFORE A CRASH!

Your problem is guessing when someone is going to trip over your power cord or blow a fuse...

If you have a few APRS stations on the frequency, all running, and all saving automatically, then even if one station goes down, the others will still be saving.

I would suggest that if someone goes down accidentally, and he wants to simplify the after-action re-construction, that he radio someone else to do a FILES-SAVE and to jot down the DATE/TIME of the track history file saved. Then when he is back up and running, ask the other station to do a SECOND FILE-SAVE and again record the DATE/TIME of the track history file. THEN, after the event, all the original station needs are those two files. The first will have most of what he lost, and the second will have all that he missed until he came back up...

REMEMBER when combining files, that APRS saves the entire P-LIST at the start of each track history file, and then ADDS all subsequent new position reports. You can either leave these DUPES in the files when you combine them (so that long replays also restore the positions of all the fixed stations) or delete them after the first, to save space...

gud luck

137. Re: [APRSSIG:345] APRS maps from CDROMs

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>

Your problem with the 2,000,000 maps is trivial (I HOPE): DO NOT SELECT OPTIONAL FORMAT.... SELECT GRAPHICS FORMAT. MAPFIXER is looking for .GRF files. I hope that my DOCS dont say OPTIONAL!!!!

Maybe you got confused, because the CONV100 program REQUIRES OPTIONAL format which it then CONVERTS to .GRF format. We wouldnt even need CONV100 if the USGS would output the 100,000 maps in .GRF format.

I would guess that that digitizer format should work. BE SURE IT IS IN POINT MODE. in other words, it DOES NOT OUTPUT CONTINUOUSLY, but ONLY outputs a single line of data when you CLICK the 0 button

Regarding the overwriting of lines and cleard maps that a TEXAS station reported, that happens quite frequently when monitoring a packet channel that has BBS, NETROM or other packets. A single embedded FF or any other messy control characters will do what they are designed to do... APRS is monitoring the channel. If a monitored packet has a glitch in it, then that will GLITCH your screen. I suggest using BUDLIST to reject NODES and BBS's.

Concerning saving all new packets to disk... (for the guys trying to find the beeps)....

APRS saves a chronological file of ALL new BEACONS in the LOG directory...

Use that to search for old beacons...

But I think that the BEEP has been found to be caused by APRS on each NEW beacon. I will try to make BEEPS OFF squelch that...

141. Newbie Question - Mac APRS?

3-21: Bob, just tried to do a gps mobile run. Position updated on screen only @ 1 min, vice the 10 sec updates i set via posrate. Saved the file and confirmed that each of the 16 lines that were saved all say "last nmea fix", vice the "rmc fix" that i normally see in my gps track histories. The on-time was about 15 mins. Should have had many more positions reflected in the HST file. Running 6.6 under HSP. Additionally, when I load these into a map using mapfix/mapfixer, the program says "plotting gps..." but nothing appears on the screen. Compared it to a tk hst I did in sdgo. Only diffs are after @151634 in good file is a "z", and new file is a "/", plus the last entry "last nmea fix". Would you please check that the fact I'm in southern/eastern hemispheres (S/E) are not causing probs. Also confirmed that mapfix/fixer are not source of prob, as I overlaid a gps hist file onto the sdgo map with no problem. Just ran another test. APRS toggles @ 10 secs as I specified in posrate, and updated on screen. However when I reviewed the HST file after 10 minute track, the file only had posn updates @ 1 min saved, with last entry of each line "last nmea fix", vice "RMC Fix", which I've got listed in other HST files. So, in sum, it appears that APRS is working OK in GPS mobile mode, but not all the position reports are being saved. Thus when I bring up the gps track in mapfix/mapfixer, there is no history to plot. Turn it over to you. Regards, Dave.

Rendered body type: text/plain

The "last GPS fix" data seem to indicate your receiver lost its lock to the birds. At least, that is what I see when my receiver has lost lock, and is sending the last position over and over and over. You might try, next time you see this, to do an 'OCG' to look at what the GPS is putting out directly.

My experience is limited to Motorola PVT-6 and VP-OnCore engines.

73, gerry

Miles,

There is an excellent version of APRS for the MAC. Keith Sproul wrote it. His uncle lives in Round Rock and is a ham. He may even be in the roster.

I don't have any info on where to get it. If you don't get an answer quickly, I'll try to do some digging and get you the information. I may have it in the stuff I brought back frm the TAPR meeting. (Now if I can figure out where I put it. ;-)

The current release of MacAPRS is up on

ftp.ucsd.edu in the directory /hamradio/packet/tcpip/incoming

Some of the files (Map and Data) are already up on ftp.tapr.org

The new version (1.4) will be up on both of these sites soon. By the end of the week for sure, maybe even today (Tuesday).

Hi Keith!

Jim, WA5LHS, also replied to my request, mentioned that you have an uncle
in Round Rock, just north of here. This morning I was rooting around at
ftp.tapr.org when your message came in. I will probably wait until you put
up version 1.4. Thank you for writing it!

Rendered body type: text/plain

DOBBINS reported running a 15 minute mobile GPS test but APRS only saved
some of the reports, not all. There is not enough information for me to
work on. Here are some thoughts:

There are MANY GPS modes, and each one has its own code:

HSP, SPM or 2nd Serial port OR stand-alone mode
GGA, GLL, or RMC
In Stand Alone mode: PACCOMM, AEA, KANTRONICS, TAPR, OR normal UI mode

This results in 4 x 3 x 5 or over 60 different combos of hardware.
EACH COMBO HAS ITS OWN UNIQUE FEATURES AND QUIRKS..

NOTE that APRS ONLY saves reports that are DIFFERENT more than 80 YDS. If
the vehicle was NOT moving, then you will NOT get a track history.

When APRS puts the words LAST NMEA FIX in the posit, then the GPS
available BIT in the GGA sentence is a 0, and the posit is NOT current.

SOME GPS's send old posits when they loose a fix. SOME TNC's send old
posits when they loose GPS input..

SO, this is not a FLAME to DOBBINS (a very good APRS supporter!) but a
reminder that if you have a problem, I need to know EVERYTHING. And
unfortunately, that takes a lot of typing.. hi hi OH yes, always tell me
your version of APRS too...! There are lots of variables there too!

ANSWER>

Sorry, OM, you are mistaking your ALIAS with your DIGI path. if you set your ALIAS to gate/WIDE you are making your alias on HF be GATE which IS A DISASTEROUS THING TO DO. YOUR STATION WILL DIGIPEAT EVERY PACKET on HF back out onto HF! (doubling the QRM!)

If you are trying to be a GATEWAY, then you should set your MYGate to GATE. DO NOT SET your MYA to anything other than ECHO on HF and RELAY on VHF...

Finally, then, your UNPROTO path should be set to GATE,WIDE on HF so that your station packets are gatewayed by other gateways onto their local VHF nets. You may set your VHF UNPROTO to WIDE or whatever you need to get through your local VHF digipeater...

To REPEAT, do NOT set MYA to gate.

>their basic OEM module. Not about any particular GPS product.
>If they are now providing a basic GPS card with NMEA output, I d love
>to hear about it...

The Rockwell NavCore V and MicroTracker GPS OEM receiver boards both use a serial data port for their communication both in and out. They both initially used a proprietary Rockwell data format. Rockwell now has available the MicroTracker LP which provides the NMEA 0183 serial data format. In addition, it has a second serial port for RTCM SC-104 differential correction input. The board is 2.0"x2.8"x0.36" and requires +5VDC only power. As with the NavCore V it is a 5 channel receiver but tracks up to 9 satellites. On the price sheet I have it sells for \$355 in quantity one. Hope this helps. I have fairly extensive information for the Rockwell boards and for the GEC Plessey GPS Chip Set and some information for about all of the OEM boards.

REMINDER TO EVERYONE:

When you download a new version of APRS from now on, the MAPLIST.APR (USA) will overwrite your current copy of MAPLIST.APR (which will be your own customized list, or one of the three EAS,CEN,or WES versions. That is why the basic APRS file contains all MAPLISTS.xxx.

To restore the MAPLIST for your area, simply COPY the MAPLIST.xxx appropriate for your area to MAPLIST.APR...

154. APRS version 6.7a (and BEEP comments)

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Tue, 21 Mar 1995 15:12:20 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950321145512.9183C-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

I just posted 6.7a which only makes a few minor tweaks to 6.7 (no bugs so far). The tweaks do the following:

- * Draws the 3D ALT scale last, so it is NOT overwritten by CALLS
- * Sounds a unique BEEP when ur station hears someone ELSE Ping.
I find this nice to know that a HUMAN operator is out there playing
- * Changed FILES-REPLAY so that it does NOT always re-draw the map (this takes advantage of the MAP SCREEN page flip introduced earlier)
- * XMT command now prompts for which packet to send, vice sending all of them.

This new EXE and just a new NEWNOTES.txt are posted in a 67to67a.zip file which is about 170K I think....

If you already got 67, you may hold off to see if any BUGs are reported. If you havent gotten 67 yet, be sure to get this upgrade file.

MORE ABOUT BEEPS. I tested my APRS again last night, and it is totally silent if BEEPS are turned off..... What I realize now, is that the stations that are compaliningin about BEEPS probably have old versions. Somewhere a few months back I squelched all BEEPS.

IN CONCLUSINN.. If you note a BUG, or feature, BE SURE TO TELL US WHAT VERSION you are running....

FINALLY: To really see the beauty of the 3D display, be sure to replay all three files: BALLOON1/3 and AIRCRAFT.hst

The Rockwell Microtracker LP that I discussed would be ideal. For more information you can contact:

Spectra Systems, Inc.
600 North Pine Island Rd.
Plantation, FL 33324-1304
TEL: 305-475-0070

There are a number of other similar boards with NMEA 0183 output from Motorola, Trimble, Magellen, etc. They all sell for between \$350 and \$600.

157. MacAPRS 1.4.0

From: Keith Sproul <ksproul@hardees.rutgers.edu>
Date: Tue, 21 Mar 95 15:36:53 EST
To: aprssig@tapr.org
Message-ID: <CMM-RU.1.4.795818213.ksproul@hardees.rutgers.edu>
Rendered body type: text/plain

To: APRSSIG
MacAPRS list (done via BCC to not include long list of names)

MacAPRS 1.4.0

Dual Port TNC Release

MacAPRS Version 1.4.0 is now up!

ftp.tapr.org aprssig
ftp.ucsd.edu /hamradio/packet/tcpip/incoming

This release has MANY new features!! Most of them are listed below...

* Dual Port TNC Support. If you have an AEA PK-900, AEA DSP-2232, or Kantronics KAM, you can now PROPERLY support both ports. MacAPRS has been supporting and recognizing dual port data from these TNCs for awhile, but it did not send data out to them using the dual port mode features. It does now. For example, if someone sends you a message on VHF, it will only ACK on VHF..

If you select a station to send a message to, it will ONLY send it on the band that station was first seen on.. You can always override this too.

The dual port stuff will also work if you have two different TNCs on two different ports.

* Balloon Support. Some of the balloon features have been in MacAPRS for awhile, but now there is a BALLOON STATISTICS window that will show the altitude plot of any tracked station that has altitude data. The other balloon prediction stuff is progressing quite nicely, but is not finished yet.

IF YOU HAVE AN INTEREST IN THE BALLOON STUFF, PLEASE LET ME KNOW BY E-MAIL!

* Automatic Tracking. If you turn on this feature, any station that is of a moving station type (car, truck, plane, boat, hurricane, etc) it will AUTOMATICALLY create track data in memory..

* Station Selection In PC APRS this is called JUST. This is a dialog box that allows you to select which types of stations get displayed on that map. This is selectable MAP BY MAP. For example, you can have one map of an area showing all stations, and another map of the same area showing JUST the weather stations, and another map of the area showing JUST the gateway/digipeater stations.

* Flagged Stations.. There is now a FLAGGED STATION list window that will show only those stations that have been 'flagged'. To FLAG a station, go to any one of the other station lists and select a station, then hit the 'F' key. This allows you to show only those stations that you are interested in.

* FIND See if you can find out what is new with the FIND command. :-)
The FIND command used to work ONLY if you were in a MAP window. Now, if you have any of the LIST windows open, you can find many other things..

Station List,
When list
Weather List
RDF List
Flagged Station List

You can find a call sign... It will automatically scroll the window to the call you type in, AS YOU TYPE IT..

Airport List
You can type in a CITY name or a CITY name and STATE to find the airport codes. This searches ALL 22,000 airports in less than a second!

DX Countries List
You can type in the PREFIX and it will show you the country name.

* B&W support
(If you have a B&W display, 1 bit, not gray scale)
The MESSAGE window now displays messages TO you in italics and BULLETINS underlined. If you have a color display, they stay in the colors as before.

Ive been getting the Motorola VP OnCore engines for \$318 with the LNA Preamp onboard, allowing use of the M/A-Com ANP-C-109 passive patch antenna (\$36).

Contact CA Richards, Houston TX for the GPS engines. They've indicated the first break below that price is at 100 qty... M/ACom has been real good about selling small quantities to us for a little cow project...

73, Gerry

Rendered body type: text/plain
```

Although this is a hobby, anyone that figures out how to make APRS maps easily and efficiently (and that is looking for some extra income to keep his HOBBY going) should have no problem selling them. As you can see, there is a DEMAND for APRS maps. and the country is BIG!

If you are a student, or retired, or just have time on your hands, you will get no objection from me if you want to make APRS maps for hire... Unfortunately, once you make them, they sort-of become public, so do NOT expect to make royalties after you release it. If you are going to go into this business, let us know!

I suspect tho, since it is very geographically explicit, a repeater or local club might be willing to fund the making of a local map for their area. Everyone in that area would want it, but NOT too many folks outside of the area would.

I have found that with a good (BIG) digitizer, that it takes me about 4 hours to do a 7.5 min map of a reasonably urban area. Less than 2 hours to do a more rural area. The only thing you need is for the customer to send you the original paper map to digitize.... Figure your time, and I would think that some HAM groups might be able to afford your service...

I have not yet made a complete map with the 100,000 CD ROM data. It takes hours and hours (I could probably learn to do it much faster, but it still seems more tedious and frustrating and glitchy and HUGE! The only advantage of this method, is that you dont need the customer to find and send you a paper map. But you would need all 13 CD ROMS to cover the whole country... Pllus you are stuck to the USA.

This message is not meant to commercialize or to detract from the grass roots public domain concept of APRS maps, but is simply meant to encourage anyone with the time to make themselves availalbe to groups that need maps.

KUDOS and homage to all of those very dedicated APRS map makers who have slaved and divorced over these maps! Their contributions without remuneration are fantastic!

Map making is fun and adicting (look at the efforts of W7KKE, KB8JX0, KG8GE, KG0DW, WH6YHC, KU0G and many others listed in MOREMAPS.txt!

COmments anyone???

The most fun way to make a map is to get in the car and drive around with the GPS on. After a few months you should have a nice local map of all the places you usually go... Bob kirk N30ZB

Although this is a hobby, anyone that figures out how to make APRS maps easily and efficiently (and that is looking for some extra income to keep his HOBBY going) should have no problem selling them. As you can see, there is a DEMAND for APRS maps. and the country is BIG!

....

Well, there is a different solution in the works (although it WONT be out by Dayton)...

I have had SOOOOO many requests from frustrated PC users about Maps that I have decided to take my map-making abilities and create a feature that will load the entire MAP array(s) into memory, then do a re-iterive (sp?) size reduction on it, showing the user the results each pass thru.. This will make use of extensive graph/map/polygon type manipulations, and will re-connect the un-connected points (or at least they SEEM unconnected) from the USGS data bases..

This will be done in the MAC version, but will create the map files for PC APRS. Due to the size of the original maps and the complexity that might be involved, this will be probably require a lot of memory to run. (In PC terms anyway, in Mac terms, it will run on most of the color Macs out there).

I have already started to do some of the analysis to figure out ways to further and further reduce the data points, but I do not expect to have this done for a few months.. (do don't bug me to much :-)

I have experimented some with the 1:100k DLG's from USGS. The data are 1976 vintage, making them kinda questionable. I'm working now with the Mapping Sciences Labs at Texas A&M to determine if we can input automagically some newer data from Texas Dept of Transportation. While I realize this isn't much good for the rest of the country, it does open some avenues if we can figure out the headers, etc.

I'll keep y'all posted.

Paul,

You'd not mentioned that you guys were. I've looked at it and wasn't too impressed... if that's the one I think: fixed antenna, a patch mounted to the board?

Does Garmin still retain the insane idea that they should lock out dynamics above 90 or so knots and/or at altitude?

Randy,

I've not gotten anywhere with the TxDOT maps for the region just yet. We're awaiting a care package from TxDOT at the Mapping Science Lab, and we'll go from there. If it's successful, I intend, over time, to try to generate 1:24k based maps of the major metropolitan areas, as well as where my cows will be.

Cows In Space is coming along slowly. I've started seeing some integration problems with the PacComm TNCs I've been using, almost certainly operator induced. Once I get past that, I expect to be back on track... or on the trail.

We're supposed to go to fabrication on the boxes this week. Motorola told us today that they were interested in supporting us with hardware, to the tune of 20+ GPS boards. TNCs and radios are in house. I've started integration and software development of a low-cost differential reference station... shooting to provide similar services at a cost significantly below Ashtech or Trimble... NASA has given us enough lithium batteries for 1-2 months of operation, maybe more... Gotta see how the actual power budget works out as opposed to the (conservative) estimates. And we're now looking at alkaline batteries for a low-cost alternative to the space-rated lithium cells.

I'll post more when it's available. I suspect we'll have a web page up on this eventually.

169. APRS and Compaq Contra Aero

From: dlarsen@spider.lloyd.com (Don Larsen)
Date: Tue, 21 Mar 95 22:15 PST
To: aprssig@tapr.org
Message-ID: <m0rrJhb-0008FZC@spider.lloyd.com>
Rendered body type: text/plain

Hi,
I have enjoyed APRS since ver3.?? on my desk top computer. I would like to take it mble on my laptop computer, but I have never been able to get it to run on the laptop. Let me start at the top. The laptop that I am trying to use is the Compaq Contra Aero 4slc/25. The current version of Aprs is 6.6. The problem is as follows. When I try to start the program I fill in all the parameters and when the program starts, it locks up when trying to initialize the tnc. At this point the computer has to be powered down to escape the program. As I said at start I am running the same version on the desk top with no problems, but have never had any luck with the laptop. I have tried all the possible configurations at the start up with no change. If however I chose no TNC then I can input objects on the screen and it seems to be running correctly, but who can tell since I have to post everything. If I hook up the gps unit to the computer, it will either lock up the program or crash the program. Again the gps works fine on the desk top.

Dose any one have any suggestions? Or maybe a call to Compaq tech support?
What do you think?

Hi Gerry,

I wonder if the handshaking is different than that used to run normal packet on the KPC3, I have run several communication programs with the TNC on regular packet and have not had a problem. Thanks for the input

But don't expect any info on comparing brands. It's pretty much of a trade magazine, so they never offend any of the companies (and advertisers). They

do an annual listing of the specs of most all the units, though, which is useful, and they do publish all the manufacturer's press announcements, so you know what's new. They also cover the Washington lobbying front.

They just published an article where an agency or university did a comparison of the performance of several units of different types, but removed the brand names: called them Brand A, Brand B, etc. Real useful.

Concerning the fellow that had probs getting APRS to run on his LAPTOP:

The first thing I would check, is available RAM. APRS 6.6 requires over 550K of program memory to run. Type the MEM or CHKDSK DOS commands to see how much PROGRAM memory you have. If you do not have enough., rename your autoexec.bat file and start the PC and then check how much RAM. If still not enough, you may need to modify your CONFIG.SYS to use up less memory.

The reason it runs without the TNC or GPS, is beacuse they need the serial port, that takes up about 3K of memory additional...

Oops! i was braindead this morning! Not enuff coffee!

The KPC-3 is different. Make sure you're not in the new user mode, since it
makes you lose some important commands. We saw this at a meeting here locally
a couple of weeks ago. I'd reread the manual (I use PacComm hardware pretty
exclusively) and recheck cabling to proceed.

181. Agrelo 2m Radio an APRS

From: edwardwr@interaccess.com (Edward W Rogers)
Date: Tue, 21 Mar 1995 06:59:31 -0600
To: aprssig@tapr.org
Message-ID: <199503222334.RAA20527@home.interaccess.com>
Rendered body type: text/plain

Hi all,

Dave KA9NHL and I have both recieved our "radio on a chip" from Agrelo and
are impressed with the units overall preformance. Units will soon be
installed into TNCs for balloon flights and stand alone trackers.

The one concern we share is the lack of a PTT function, as it stands now
when radio is on it xmits data.

Im thinking maybe we can control the power to unit via a switch or relay off
of the TXD LED and set the TNC TXDELAY command to a high value to allow
radio to get stable before it xmits.

Not being much of a solid state kinda guy (all my HF stuff is Heathkit)
anyone got any ideas

You are correct about the new user mode on the KPC3, APRS dose very little
in this mode, but this is not my problem either. I am beginning to think
that it will take a call to compaq and see if they have any other ideas.
Others on the net have told me that they are able to run the program fine.

>

>Bob mentioned that it could be that there wasn't enough menory but when
following his directins and freeing up memory up to 598K there was no
success in starting aprs it continued to lock up at the point where it
repaint sceeen and initializing tnc

I have been lurking on this list for a month or so and have been facinated with the discussions.

i would like to offer a correction to the telephone number for Spectra Systems, Inc:

407 998 3160

I called them regarding their rockwell novcore offerings. there is a developers package with everything one needs to get rolling - board, power supply, interface (rs232), documentation and development software (PC) - the whole ball of wax for \$995. bare boards are also available but with NO documentation.

gerry creager wrote about the availability of the motorola OnCore engines and said to contact CA Richards, Houston, TX. I would like to investigate the OnCore engine. how do i contact CA Richards?

i would like to experiment with a gps engine but have never found a source that would sell me just one unit. are there any other places where i could inquire about boards,

also, i am very interested in DGPS. does anyone have experience with some of the available services, especially the DSI system that is piggybacked on FM station subcarriers?

any advice/assistance would be appreciated.

regards
vic fraenckel

186. Initializing PK232

From: William Manley <z002594b@bcfreenet.seflin.lib.fl.us>
Date: Thu, 23 Mar 1995 07:24:41 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.3.89.9503230758.B8844-0100000@bcfreenet.seflin.lib.fl.us>
Rendered body type: text/plain

Here is a suggestion to put into the queue for upgrades of APRS.

I use a PK232 for both APRS and routine other packet applications. Another application leaves my PK232 in the MORSE mode upon shutdown. If this is followed by an APRS application, I find that I must manually get into the cmd mode and change to "packet" from "morse".

My suggestion is that APRS initialize the PACKET mode upon startup.

73,

KB4XE

? GPS-40 HANDHELD UNIT

This is a amazing GPS Handheld unit. Cost in the Detroit area is \$349.00.. I have heard that in some of the East and West coast areas it is now in the range of 299.00.. Weight of 9 ounces.

Battery life is a remarkable 20 hours when used in battery-saving mode, unit runs on 4AA's battery. GPS-40 can store 250 waypoints and up to 20 reversible routes with 30 waypoints each. MOB mode with bearing and distance to mark. Moving Map Plotting with scales to 1/5th statute miles. Physical size 6.15"h x 2"w x 1.23"d. Acquisition time Approx. 20 seconds (warm), Approx. 2 minutes (cold), Approx. 7.5 minutes (AutoLocate). Update Rate 1/second, continuous. Position Accuracy 15 meters (49ft.) RMS.

This unit is a true handheld in the lines of amateur radio, small size fits in the palm of the hand, has a build in antenna and your able to add an remote-mount magnetic active antenna. GPS-40 has connections for power 5 - 8 vdc, and input/output for data, it has NMEA interface capability.

John - I think your GPS unit has a control/display processor that is "talking" to the NaveCore V using the Rockwell proprietary serial format and then using the information to generate the NMEA 0183 serial output. I don't think Rockwell ever supplied any NaveCore V's with NMEA output although they have a development version of the software that provided it.

189. Forcing a map

From: Jess Girard <girard@panix.com>
Date: Thu, 23 Mar 1995 10:15:41 -0500 (EST)
To: APRS Sig <aprssig@tapr.org>
Message-ID: <Pine.SUN.3.91.950323101104.14429E-100000@panix.com>
Rendered body type: text/plain

Hi All:

Bill, wa2tqi, modified the map nycityli.map (I think that's the correct name) to enhance details in our local area in Fairfield County, CT.

I cannot seem to get this map to come up. I know it's there, I see it on the maplist file, but I can't seem to force the program to use it. I renamed it ct-li.map as an experiment and, indeed, then the program sees it with all the enhanced details included. But it's not the real ct-li map so I didn't leave things that way. I know I can use mapfixer or whatever it's called to import those details but I'm still mystified about why I can't force the nycitli map. Any ideas, anyone?

I'm using v.6.7a at present.

190. GGA and VTG sentences

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Thu, 23 Mar 1995 10:29:13 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950323093840.27675F-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

I have now had a few reports of APRS/GPS units not showing their course and speed when using the GGA and VTG sentences. I watched a local driving around, and probably only got course and speed 10% of the time..

Also, there is the report of the PK-12 not showing up with cse/spd.

I need more feedback. processing the VTG and combining it with a GGA from the same station is quite involved. As I pointed out before, there are over 60 different combinations of GPS-TNC and processing involved.

There are TWO ways for GGA/VTG to be transmitted FROM A STAND-ALONE-TRACKER, either combined into one frame with one header, or in separate frames with separate headers:

```
W3XYZ>APRS:$GPGGA.....CR/LF
$GPVTG.....CR/LF
```

Or:

```
W3XYZ>APRS:$GPGGA.....CR/LF
W3XYZ>APRS:$GPVTG.....CR/LF
```

The single packet version is what I use by placing the TNC in CONVERSE mode with SENDPAC changed to NOT be CR, and setting PACTIME to 1 second. This makes sure that the two ALWAYS are sent in the same packet. This assures that BOTH get through a digipeater together...

The second TWO-PACKET version will probably be the result of most of the TNC MANUFACTURES GPS modes... Although there are two separate frames, they MUST both be transmitted in the same PACKET in order to be digipeated together

APRS holds every GGA or GLL packet for 2 seconds before finally building a received position report.. If a VTG comes in within those 2 seconds, then it is applied to the same POSIT to give CSE and SPD. If it is later, then the VTG is ignored.

If you see any other combo of GGA/GLL/VTG, let me know what TNC and configuration is doing it. WAS a digi involved??

Now, in HSP mode, where the TNC is not involved and APRS is trying to read both the GGA and VTG from its own serial port, the same 2 second hold applies. In this case, APRS is looking for the raw strings WITHOUT packet headers (in fact, that is the only way it knows it is yours vice someone elses in HSP mode). Since most GPS units output at at least a 2 sec rate, APRS should get a GGA/GLL and VTG in that 2 secs....

Recently I did drop the 2 sec period down from 3 secs that it had been before... Maybe that is causing a problem??

SO, IF YOU ARE RUNNING HSP MODE AND YOU DO GET CSE/SPD, let me know. If you are NOT getting cse/spd also let me know. In both cases tell me everything... TNC, HSP switch, APRS version, NMEA RATE! (1 sec,2 sec etc)

REMEMBER that many GPS units do NOT output VTG if you are sitting still, so be sure you are moving before gathering your opinion. Also, look at the several NMEA strings coming out of your GPS. Tell me the order:

```
$GPZTG...
$GPGGA...
$GPVTG... (APRS assumes that VTG always follows GGA/GLL)
$GPxxx etc
```

Thanks for your input.

191. Re: [APRSSIG:405] Initializing PK232

Rendered body type: text/plain

OK, I give up, how does one change the PK-232 out of "morse" and into "packet"??

It is not easy writing software that is compatible with all of the in-compatible TNC's out there... and I cant afford to have one of each....

So please when you send me TNC specific ideas, please send me the EXACT command structure required to do what you ask... AND be sure you specify EVERYTHING required.

Remember, APRS has NO IDEA what mode or condition the TNC may already be in... So give me the sequence that will work in ALL CASES (EVERY POSSIBLE MODE).. hi hi

> I cannot seem to get this map to come up. I know it's there, I see it on
> the maplist file, but I can't seem to force the program to use it. I

ANSWER: Please read the MAPS.TXT file concerning the heirarchial order of MAPS listed in the MAPLIST.xxx file. Just being listed in MAPLIST.xxx makes the map "available" to APRS, but it will only be USED if it is the "last" map in the list that covers the same geographical area. Thats why smaller and smaller maps are listed later and later in the file...

Thats also why you cannot alphabetize the MAPLIST.

In many cases you cannot even put all maps of the same state in order, since every map that crosses a state border, must also logically/heirarchly fit in with all maps of all adjacent states.

A new map will ALWAYS work if you make it the last one in the file, but then unknowingly, you may be obscuring some other map further up. Use the MAPS-BORDERS command to see ALL maps that overlap your area. Put your new map AFTER the last one of those maps...

Rendered body type: text/plain

How about adding a "setup.tnc" file to APRS. Then TNC specific commands could be sent to get the TNC in the desirable state prior to APRS making assumptions about the TNC. Just my \$.02 worth.

194. Getting GGA and VTG out of a single TNC....

From: paul@paccomm.com
Date: Thu, 23 Mar 95 13:07:59 UTC
To: aprssig@tapr.org
Message-ID: <1796@paccomm.com>
Rendered body type: text/plain

If you use the Trimble SVee6CM(2), then you can get both GGA and VTG from it with an PacComm product.
The Trimble outputs only \$GPGGA and \$GPVTG, so just set:
GPSTEXT \$GP or GPSTEXT \$G or even GPSTEXT \$!!!!!
GGA and VTG will be picked off as they sync with your beacon rate....

I snarfed a copy of APRS6.7 the other day and had a blast just playing the balloon and plane history files with the Y command on.

Bob, thanks for that feature!

I'm sure we'll get people putting that to use!

Also, I've been able to surf over to ftp.tapr.org and get 6.7 as well as the upgrade from 6.7 to 6.7a.

Hi agn. Well, the prices just put out on the SIG are in error.
In E & B, West Marine and BOAT/US the prices right now are as follows:

Garmin 40	Case, but no data no bracket	\$249
Garmin 45	Case, but no data cable, no bracket	\$298.99

You can add the data cable at \$29.99 or the bracket at \$29.99 at any time.
There's also the GPS-45 WITH cable and bracket at \$345, take your pick!

These prices have been available since the publication of the 1995 catalogues from the above suppliers. To get BOAT/US pricing you must be a MEMBER (i am because my boat insurance is thru them). They WILL check at the check-out (they have to swipe your barcode on your membership card).

All these stores (they have over 150 stores nationwide) will PRICE MATCH, so if one is out of stock (VERY likely), you can go to the next and get the best price. Last time I was in a boat store at lunch time THREE GPS-45's were sold to people while I was there buying a radio!

Footnote: West Marine last year steadfastly said they were continuing to offer and stock LORAN-C units. This catalogue there are NO units to offer at all!!!!!!!!!!!!!!!!!!!! (of course, no comment was made!) Paul.

I have a Magellan Developed I got 2yrs ago for \$475. (Sure less now).
This is nice as you have access to all commands via the serial port.
calling Magellan and request development kit.

RE : GPS World.

I've been getting the magazine for about 18 months and been thru two of their annual product reviews. It is a good quasi technical mag which displays a lot of different project GPS has been used for. They also have an annual Product review Tabloid size issue with mailin info request cards. (PacComm even advertises there, so it must be a good mag).

They also have an annual contest for the most useful/unusual/etc use of GPS, and I've attempted to submit APRS nexy go round. Is it worth the cost of a subscription ? If your heavy into GPS yes.

Hmmm - maps for hire... How about if we put in a note asking for donations in an effort to keep the mapping going, kinda like "Shareware"

>
> I suspect tho, since it is very geographically explicit, a repeater or

> local club might be willing to fund the making of a local map for their

This is true - unless you are seriously into maps, why do a map
unless there is a need or a request (Ever wonder why I stopped doing Ohio
maps and moved on to Mich ????)

> I have found that with a good (BIG) digitizer, that it takes me about 4

To hand digitize a 30 x 60 min quad map will take anywhere from 3
to 16 hours, depending on the number of curves in the roads and
borders. And rivers/coastlines are a real bear. Buy the maps yourself can
get expensive - the 30 X 60 are \$4.00 @ and I have over 30 of them for Ohio.

Bob,

Since there are so many TNC's why don't you have a startup.tnc file (similar to your restore.tnc file), so that we can make changes as required. But in your required settings, but allow the end user to modify some of the other settings. For example, most of my other software for TNC's wants to turn the monitor function off when I exit (DSP-2232), I have to remember to go back and turn the monitor back on (usually after I see the APRS did not see your..... msg).

Just a thought.

BTW, I have the ability to compile this under os/2. Would you be interested. You can drop me a note directly: mwalker@interlog.com

Thanks for all the fun....cheers...mike

Hello Bob,

I reported the standalone problem with the PK-12, and the programmer at AEA (I forget his name) is sending me a new EPROM for the PK-12. I watched the raw data (even at 6.7) and I still am not getting course and speed at my home station when running with and ICOM gps and PK-12 standalone. It seems to work just fine when I use a laptop and HSP.

I'll update you when I receive the eprom from AEA. I will also test the new KPC-3 software when I receive it.

Cheers...mike

If you're talking about StreetAtlas, MapExpert, etc., from DeLorme, no chance. They cannot see how the data might make 'em any money thru bulk!

Couple of us down this way have tried. If anyone else has had significant success with 'em, please let me know.

Rendered body type: text/plain

The PK232 is placed in the packet mode by typing PACKET while at the cmd line. I'm not aware how APRS sets up or initializes the TNC. It must be a challenge to cope with the vagaries of all of the TNC products. The PK232 is of course among the most popular.

When its battery is installed (as mine is), the PK232 remembers the mode it was in when it was turned off. It has many modes of course: PACKET, MORSE, AMTOR, RTTY, FAX, CAL, and on and on. Most programs written for it provide menu options for changing modes. Of course only PACKET is useful for APRS.

After I boot APRS, I sequence Operations/Comm/TNC and then simply type 'packet' at the cmd prompt. I notice that, during the boot, APRS sends a number of initialization commands to the TNC. I was simply suggesting that PACKET be among the commands.

It's no big deal either way. It is a simple task to manually set the mode. Sometimes however I boot and leave the shack. On these occasions, the PK232 is not functioning on packet until I return to complete the setup.

Yes, Mr.Bruninga, I think I found a buggie in v6.7a...

I hit F9 to show everyone in the Positions listing and it displayed the map of the USA from the East Coast to about Arizona displaying everyone that it had heard.

I then hit "Y" to see if anyone was HIGH and found no one had been drinking but did notice that there were some objects, houses and cars, floating around the Los Angeles area.

I then hit "Y" and then F9 again and still those folks in Californy did not show up, that portion of the map was NOT shown.. I then moved the cursor further west and hit HOME and now they all showed up..

When I hit F9, why were those folks in Californy not taken into consideration in calculating the map to display?

With all this talk of maps I wanted to add my two cents worth. APRS is not yet big in our area. For awhile we had a ham who was keeping it going, but he retired from the Navy and moved to the mid-west. Now there is slight interest, but nothing full-time in operation. Personally I am most interested in it from a couple of perspectives. First, I am interested in weather, so a full-time weather reporting net would be nice. Second, our local club supports a few local events (ie races) for which APRS tracking would be nice. Third, and most important is Foxhunting (one of my real loves in the hobby). I would love to get a very detailed road map of my county so that even a foxhunter without a gps could specify a location (click/point to it on the map) fairly accurately and input a manual RDF report. Most of the hams around here can't afford the fancy equipment for a fully automated station, so we would need to be able to start with minimal automation and add things slowly.

Went to do a map of NYseast last night and after doing the whole CDR0M 2,000,000 extract procoess, I found out that the CTRL-SAVE function just would not work. COuldnt save the file! The problem is that I had changed the main KEYBOARD COMMAND parser from IF THEN statements to SELECT CASE statements. The problem is simple... Move the following two lines which act on the CTRL-S and CTRL-C characters from line 326/7 back up to the

previous SELECT CASE BLOCK around line 262....

```
CASE CHR$(19):.....  
CASE CHR$( 3):.....
```

SORRY, I was trying to condense the code.. I also notice that the NEW non-destructive CURSOR leaves cursor artifacts on the screen. It doesnt mess anything up, but is just anoying... Ill try to fix that soon...

The beautiful thing about QBASIC, is that when I found that I could not save an hours worth of work, I simply used the BREAK key, looked at the code, moved the two lines where they should be, and then hit F5 to resume. Then the save worked properly. Actually, I had QUIT the program which meant that if I hit F5, everything would be lost as the program started over again. In that case, i used the IMMEDIATE window (F6) and simply executed a GOTO MAIN which jumped into the middle of the program and allowed me to continue with the existing map data....

REPLY: Too bad I forgot to add altitude to the SHUTTLE.HST file! Im going to do that today and include it in the next APRS release. You can do it yourself, simply use a TEXT EDITOR and add /A=999000 to the end of the ST599 positis in the file (the altitude functino is limited to 6 chars). Do not use 999999 since I may have a test in there that says the altitude must be less than 999999 (meaning 999998 is the largest permissible value) and actually, 1 million feet is about right for 200 mile orbit!

REPLY: No. Thats what made me do APRS in the first place. For three years I tried to find a commercial supplier of ROM maps that would permit me to write a program (APRS) that would use their maps WITHOUT any royalty problems. Sure, I could do it for a licensing fee, but they then claimed rights to ANY/ALL maps. I wasnted maps in the public domain, and they couldnt agree to that.

I still hope someone can figure out how to read those maps, and then

write a conversion into APRS format. Then we could tell folks to go buy their \$65 database ROMS and generate their own maps for their OWN use...

> but did notice that there were some objects, houses and cars, floating around
> the Los Angeles area.
>

REPLY: There are two things going on here. First, the F9 key tries to make the largest possible map to include all stations. I think it is erring a little bit and may leave out a few stations on the edge. I can increase the cut-off point, but that will guarantee a 50% reduction in the map size (since APRS only ZOOMS by a factor of 2). I have noticed this problem in the Carribean where several contacts just about 1 line below the bottom line should be there, but do not appear.

Second, in 3D mode, even if you are looking at a 8 mile MAP in 2d, when you squish the perspective down to 3D, you can still see infinitely to the NORTH. Since the given MAP you are using does not go all the way to the NORTH pole, there is a gap between the "visual" horizon and the north edge of your map. I noticed that VE2JOR (500 miles north in Canada) would always appear to be FLYING even when I was zoomed to 8 miles locally here. In 6.7a (or is it b that I am working on now..) I have modified the 3D display to NOT display any stations, calls, or map labels that are more than about 2 map scales NORTH of your current 2D map. If I had variable FONTS and SYMBOL size, then I could display them, but vanishingly small, so that you could tell they weren't flying, but were just an infinite distance away....

Perhaps you could be interested in my approach to creating APRS maps:

I own the PRECISION MAPPING CDROM. One of its features is that it annotates the latitude and longitude of the cursor (mouse) position. For my locality (Broward County, FL.) I pinpointed key streets noting and jotting their position as a scrolled thru the county. I acquired coordinate info for about 20 main highways which were not given in Bob's version of FLSOUTH.MAP. I used the MAPFIX.BAS program to edit that map and saved it as FLSEAST.MAP. The whole process took about 45 minutes.

Rendered body type: text/plain

Hi All:

I found out why I couldn't see the NYCityLI.map. It's rem'd out in aprs.map. I removed the asterisk and it jumped right up when I looked for it. It was in the right place as far as its sequence was concerned, btw.

Thanks to all those who suggested what to do. I appreciate your help. As the saying goes, "when all else fails, read the manual". Sigh...

Re Beeping: As soon as I entered my Validation number, all beeping stopped. That was in v.6.6 and it's the same way in v.6.7a. Bob, was it simply a gentle reminder?

I finally got out there and purchased a Garmin 40 (they were out of 45s and I actually didn't like the antenna on the 45 that much).

Now the only question that remains is what is the best means of connecting the GPS up to my Powerbook 520 (single serial port) and the KPC-3. We have had these discussions a little in the past, but I am still a little hazy here.

1. Can someone describe the cable configuration from the GPS to the computer/tnc?
2. What is the cheapest/easiest way to get there (connected) from here (Powerbook 520, KPC-3, Garmin-40)? [Keep in mind that money _is_ an object here.]

We are having a foxhunt this weekend, it would be nice to be able to send APRS info during the hunt. I haven't tried this, I wonder if it is possible to manually input not only the RDF data but the location it was received from (without manually inputting your location first)...

<<

Nope. The GPS 40 is about \$350 on the Right Coast. The GPS45, however, IS \$299. Removable bnc-connector antenna, 6-24V, NMEA output, ~100 map datum files, DGPS ready. Clearly the 45 is a better deal, no?

>>

Yup, the stats on the 40 are similar. No removable antenna, but there is a plug on back for an external antenna. The input voltage needs to be 5-8v, but their cable automatically steps it down to that range from 12v. The helical antenna on the 45 is supposed to be a little more sensitive, but is also more vulnerable to damage. All other stats seem to be the same between the two. Nice units. The 45 is also real popular with boaters, so there is a waiting list anywhere you go (the place I bought my 40 called around 5 places to see if any had one in stock, all were sold out)!

Many authors use two files. The first is a startup file with the commands necessary to get the specific TNC into the mode they want to deal with. The second is an exit file that resets the TNC to a mode that is compatible with the next use of the TNC. You as the authors tell the users how to edit these simple files and the users put in their specific startup and exit command strings.

I'm not sure if this can be done in the same manner on the Mac as the PC. The comm toolbox does not allow direct toggling of the RS-232 lines, indeed there is no reason for the program to even assume that a connection is based on an RS-232 line at all. An idea I had toyed with a long time ago was using the 'push button method' Bob describes in his doc, where the user pushes a button every time the position is to be updated. My idea was to drive this with a timer circuit in place of the push button, to allow a more seamless flow of data, but it would still require a mod of MacAPRS to take GPS and TNC data over the same port. Perhaps Keith will talk about the possibilities...

I took a more brute force approach. I bought the SerialWay unit, which places 3 serial ports on LocalTalk. I connect the LocalTalk with the PB520c, and then I can access all three ports from the PowerBook. Of course this unit cost \$600, so this solution isn't for everyone, but it works GREAT. Another idea I tried was using the PortShare program to link my PB100 with my PB520c via ethernet, and TNC to one computer and the GPS to the other. This also worked, but required me to leave the PB100 in the van. Between the EtherNet connections and PortShare (\$150) this would be even worse for most people than the SerialWay!

BTW, if you are thinking of using the PC APRS with SoftPC, I can tell you this probably won't work either. Despite many protests, insignia has not done a complete job on the serial port simulation, and hardware handshaking, which is needed for PB/PG satellite program, doesn't work.

Sorry I can't be more optimistic.

I fixed the in-ability to save a MAP in the MAPFIX67.bas program and also the extraneous cursors. This program is posted as MAPFIXED.bas since the name MAPFIX67b will not fit....

Also I improved the SUMMARIZ.BAS so that it zooms through only the new TKxxxx.HST files and BKxxxx.BK files to build a total file of ALL calls heard by your station. Before, it would always process EVERY file in your HSTS and BAKS directory, and that was a waste. This way, you use it to scan all new TK and BK files, before you delete them. so you can pick up any new calls and add them to your ALLBAKS.hst and ALLHSTS.hst files.

I also compiled the SUMMARIZ.EXE.

Also posted a NYseast.MAP

```

I put the 45 into Simulator mode and entered the 10289 feet. There doesn't appear to be any ALT info on the GGA line at all. I don't seem to be able to set the POSit time to 10 sec rate and have it actually do it that often. I see the screen flash indicating a new GPS update but I don't see a change on the screen most of the time. Any idea on this.
I talked to some other users of the 45 and they seem to have the same problems.

There are 2 NEMA modes on the 45 that are 4800. NEMA 0183 2.0 AND NEMA 0183 1.5. The strings from the 2.0 version are shown above the 1.5 version seems to be smaller in the total number of lines and freq of the update. You also seem to get the track vector line in the 1.5 mode and not in the 2.0 mode.

Thanks for that info ... I will certainly look to trying that, especially since I have two batteries on the PB. I now have a KPC-9612 for home use, so my KPC-3 is pretty much exclusively for mobile/portable use ... so the alternate power method would be nice. Now if I can link this with my GPS I will have a mega-mobile APRS tracking station ...

I saw another device, called a Port Juggler, in MacUser as I scanned through it tonight. I will let you all know more as I find more out (they have a fax back number I plan on trying out after I am done reading/replying to messages).

Hello All,
I've been interested in APRS for quite a while now and have been subscribed to this listserve for several months now. I have all equipment and have had earlier versions up and running with no problems at all. Now it's time to interface my GPS-75. Is there anything published that can be found on AOL or sent via E-Mail with pinouts and whatever information to make this painless? I'm planning a trip from Santa Clarita (North L.A. County) to Missoula Montana in late June and plan on taking the toys.

Also, I find very little APRS activity in the L.A. area. Is there a APRS calling channel in this area in use? Last time I played with this stuff the only activity was a few locals within about 10 miles of my QTH. I expected a little more interest considering the population!

Any help will be appreciated.

Thanks, Jeff Staigh - WA6EQU

I've been talking to the ham responsible for designing the ham station
in the new National Hurricane Center under construction in Miami.
According to him (KI4T), there will definitely be a full time HF APRS
station there. Bob Sheets, the present director, is apparently very
impressed with APRS, and has even expressed an interest in placing
HF/VHF gateways aboard the Hurricane Hunter airplanes to digi ground
reports from boaters in the regions around hurricanes. This latter item
is only a possibility, dependent upon RFI considerations, as well as the
opinions of the incoming director. Hope this helps you.

Rendered body type: text/plain

I was trying to run an experiment today and had no luck. I wanted to see how
well the RDFing worked using MacAPRS. It didn't! I was expecting it to plot
the information on the screen, but it didn't. I could see the information
there on the bottom of the screen, but it didn't plot anything. We should
see a line from the lat/lon given in the direction offered (beyond edge of
map). I thought it would be nice to use APRS for combined foxhunting, but it
seems that won't work since you would still have to manually plot it (meaning
it would be easier to just use voice transmissions).

>>
```

That might still work, especially if Keith offered an ability to configure for it within the program. Then you could have it switch and poll between each of the items. If I'm not mistaken, the TNC should be able to be 'paused' with a flow command while it is 'offline' so that no pertinent information is lost.

I would like to see all APRS users publish the frequency they operate on. This could be done by State & County i suppose. I would like to see a list so when i swing my beam to a specific area that i know has some APRS activity that i will know where to look and what frequency. I have been able to coordinate 145.790 here in North Alabama, but i think many accross the country have not been able to coordinate that frequency and are scattered all over. We as APRS users should be able to tell (Specially when traveling) the frequency for a certain area, more or less like a repeater map. I have made a repeater map of all repeaters located in Alabama, why could this not be done for APRS users. I'm willing to except the task of producing such a map for APRS but collecting the information may not be as easy as it was for voice repeaters!. If there are any APRS users or groups out there that have any ideas about this let me hear about it (Good or Bad). Before flooding me with information let's come up with a format Hi Hi. Give me your input on this.

I've just complete a 3 month project that mapped the southern 1/3 of the State of Michigan. These maps are based off of the USGS 1:100,000 (30'x60') maps. For the most part these are just the 30x60's, but I have done some map joining for the Grand Rapids and Detro Metro Area. These maps have the State and Federal Highways, county lines and airfield/airport locations on them. The maps also include the western tip of Ontario adjacent to Mich. The only part that is not included is the far SW tip which would be covered by the South Bend IN/MI map.

I've tried something different with these maps. Instead of marking the locations of small towns with yellow lines, I used the box symbol and placed the box in the center of the town. This make the maps sizes smaller, for faster redraws, but the locations will dissappear if the labels are turned off. The same it true for the airfields.

The map file is called MIMAPS01.ZIP and can be found on both the ARN LLBBS in Md., as well as my own LLBBB at the phone number on my tag line. See you all in Dayton.

Hi Bill,

All I can say is what I see here on my screen...From Virginia North through Maryland, Delaware, Eastern PA, NJ, NYC area, Long Island and Connecticut, it is all on the the frequency of 145.79...

I have learned that EMASS and Rhode Island are on 145.77..

So, if you go mobile and head up for Yankee Land, you better have your system on 145.79 if you want to see anyone, hi.

Take care and have fun.. 73 de Rod

Bob, V6.7a w/my KPC-3 does not display my outgoing packet at the bottom of the map display ..only my digipeated packets are displayed. Is it me or did something change in the last couple releases? I've moved and have poor digipeater coverage here on Ft Meyer and find that feature sorely missed as I hunt for a good path into the network.

Congratulations on the excellent opportunity to promote HR. Have you considered having the RACES and/or ARES organizations coordinate the activity?

de,
KB4XE

Did you turn on the "Display Course and Speed Vectors" under the "Display"
menu? You may also have to do a "Clear and Redraw" to get them to show...

>does not allow you to use more than one at a time.

My father has a device called an Axion that works fairly nicely. It
interfaces with the Mac Comm Toolbox, and switches electronically depending
on what application wants to talk to which serial port. It has 3 ports and
takes its power from the serial port. Unfortunately, it has a conflict
with MacTCP and we can't use it to dial in to our Internet provider :-(
Also, I haven't seen them in any of the Mac magazines lately...

As a matter of fact, I had the same problem with an old borrowed Yaesu until I realized the earphone/speaker jack had sidetone. Once I got that out of the system, the thing worked fine.

OK on the meters, but what about the fact it does not update the display in altitude on each fix. If I set the posit to 10 sec. I see a fix about every 30 - 45 seconds. The altitude I see about one in 10 or more. I tried this on several computers and the results where the same. What about the fact the Garman 45 has several choices in the NEMA 0183 mode. Either ver 1.5 or ver 2.0. The ver 2.0 seems to out put alot more info then the 1.5. I get course vectors on 1.5.

Just a thought for down the road. It would be nice to be able to turn off the ID on the posits durning Replay and just in general. The call letters cover up the map when you are driving along.

Actually, on the KPC-3 (which I think he said he had), there is a mxm (I think) command which will allow you to monitor transmitted packets as a function of the tnc not the radio.

The company that made those, from what I hear, has gone out of business.

Do you mean that the axiom automatically switched between the applications based on which program was seeking the port? What if more than one is seeking at a time? What about the info coming back?

Hi guys,

We're having a demo to the Cleveland NWS personnel during the Spring SKYWARN training here. Be on the air with WX info Sat., Apr 8, 9am to 1pm ET. Don't forget to have your unproto (u command) set to GATE,WIDE so that your HF packets will cross the gateway. VHF station will be set up at the Red Cross for attendees and NWS personnel to see. Let's have a big show for them!

260. MacAPRS 1.4.0

From: kc5ejk@onramp.net (Robert Winingham)
Date: Tue, 28 Mar 1995 02:06:35 -0600
To: aprssig@tapr.org
Message-ID: <v01510100ab9d7348b3f5@[199.1.11.125]>
Rendered body type: text/plain

I have noticed a few changes after upgrading to the latest MacAPRS version 1.4.0 .

0. Thanks for the balloon additions ; Do we use A=xxxxxxxx ?
1. For the first time my call and QTH show up on the map after starting the program. Yah !
2. There seem to be a few new table entries in the preference file
If you run an older version, a few of the parameters are overwritten or reset. Ant height and power come to mind.
3. Was there a change in the path name to the HAM Call files ?
I get call or path not found errors when using the find call button and no information on beacon stations.

I have move a copy of the Buckmaster Ham data file to a disk partition called:

HAMCALL in a folder called HAM0 and files called:
HAMCALL.129
STATIONS.ALL
USANAME.IDX
USAZIP.IDX
COUNTRYS
HAMINDEX
STAINDEX

This worked before and I did not need to use ResEdit to change the STR#

You Buckmaster MAC call book lookup program finds the disk based file.

I do load the CD-ROM for the world wide international Ham lookup.

A non-APRS question:

4. Is the international Ham data-base compress or encrypted - I wanted to do a text search of other Winningham in England but could not.

5. This program is very close to making me march down to the computer store and get a portable computer.

6. APRS67A.EXE (under Softwindows (12 Meg) and MacAPRS (6 Meg) running on the same Mac computer with a 21 In. monitor is a sight to see.
I wonder if Bob Brininga will give me a discount when I register or charge more. HI HI.

I'll review the command set...MXMIT doesn't seem to be recognized as a parameter...just have to locate my manual HI HI. Thanks for the suggestions...I know it worked at one time, in versions previous to about 6.5 with no intervention or tweaking of a parameter by me. I wasn't dreaming it...

Yes, it was pretty cool to watch. Let's say you had a printer on Axion port 1, a modem on Axion port 2, and a TNC on Axion port 3. The Axion was then connected to your Mac's modem port. You would then, with the Axion software, define additional Mac Comm Toolbox ports for each of the Axion ports. So then you could run a terminal program to your modem, a packet program to your TNC, and print something all at the same time! The Axion would determine which of the ports the program was talking to, and switch appropriately. Now, I don't know what would happen if you had two different applications trying to talk to the same port at the same time, but you wouldn't do that out the regular Mac port, either...

The following description of freeware for the Garmin appeared in Info-Mac Digest, volume 13, issue 036, a few days ago. I have not seen the software myself, and have no further information about it. The software can be downloaded from many of the Info-Mac mirror sites:

<description of Info-Mac software archive follows>
The Info-Mac Archive is available at 50 public and private sites around the world. For the site list, request it by mail (address below), or try:
gopher://sumex-aim.stanford.edu/info-mac/help/mirror-list.txt
Also accessible by ftp. Help files and indexes are also in info-mac/help/.

<description of MacGPS follows>
Date: Sun, 5 Mar 1995 00:57:06 -0600
From: Paul Ross <paul@paulross.demon.co.uk>
Subject: [*] MacGPS 45 version 0.1; exchanges data with Garmin 40 or 45 GPS

MacGPS 45 version 0.1 is a freeware program to upload and download data between a Mac and a Garmin 40 or 45 Global Positioning System (GPS).
Written by John Waers (jfw@csn.org).

Current positional data can be transferred to the Mac real time using the NMEA protocol. Almanac, waypoint, track and route data can be uploaded to the GPS or downloaded to the Mac using Garmins proprietary protocol.

Apart from John's manual I have included a Read.me file to help users with the wiring of the GPS to the Mac modem port.

Paul Ross

REPLY: What display? APRS? If it doesnt get the altitude every time, then
lemme know. If it is the GARMIN display... CALL GARMIN...

If it is APRS, remember that APRS must get teh GGA sentence in order to
see ALTITUDE. But APRS is ALSO looking for the RMC sentence. If it sees
the RMC first, then it will be satisfied, and NOT see the GGA...

If you want altitude, turn ON GGA and off RMC on your GPS unit if possible...

On Tue, 28 Mar 1995, Steven S. Dimse replied to SOMEONE elses query
about how to see your own packets without a digipeater:

> On the KPC-3 and KAM, set MXMIT ON, and you'll see the outgoing packets.
>

REPLY TO THE ORIGINAL ORIGINATOR TRYING TO SEE HIS OWN PACKETS: I think of
your own outgoing packets as a nuisance that take up processing time. If your
PC is fast enough that you never see I/O GLITCH
errors in the upper right display window in APRS, then I guess it is OK,
but it tells you nothing. In fact, seeing your own outgoing via the
DIGIPEATER is FAR more valuable, since if YOU saw it, then it means you
got through... and probably everyone else saw it to. If you let the TNC
echo, then you will NOT have this valuable resource available to you to
let you know that you are getting out.

OK...got it fixed....MXMIT is on the KPC3 after ROM v5.0. Now it works
fine.

Bob...I find it useful to see what I am transmitting...and the TNC, not
APRS tells me this. It takes up virtually no processing time...seeing
both the original packet and the digipeated packet helps when you're
doing what I'm doing - trying to find a path out of the barracks into
the network. In any case, the KPC3 supports it and I had grown to
expect to see it. I just couldn't figure out why I wasn't seeing it.
It's fixed. Thanks!

Rendered body type: text/plain

I am a new 6.6 APRS user. I use an AEA PK-900 and normally run AEA's PcPakratt for Windows. For VHF, I have set MYA to RELAY and using the O-C-T sequence, I set my unproto to RELAY. The map screen verifies that setting as does the "blue screen" when I check for the UNPROTO setting. However, on the receiving end of my signal, other hams tell me that all I am sending is a CQ message instead of APRS,RELAY which is what I believe I should be sending out.

Any suggestions or comments would be appreciated since I can't figure out how not to send the CQ message. Wow, do I have a lot to learn about this APRS!!

Be sure you're setting it to "APRS VIA digi1,digi2, ...etc". Hopefully
you're picking a specific path into the net and not staying with the
introductory RELAY. Also, is it being set on the right port??? Change
them both and see what happens.

DXF is a "universal" language that allows most CAD programs (AUTOCAD, etc) to import a drawing into the program; then it can be edited, then saved again to DXF. A DXF-to-MAP utility would be great for those of us who are having problems getting the digitizers, mice, whatever to work.

The problem is, the APRS screen only updates the altitude about once every 10 or more fixes that it gets from the GPS-45. It appears as if the APRS>program is not getting the fixes on a regular basis from the GPS-45. When I go to the COMM prompt and then to the GPS prompt and look at the data coming into the APRS program it looks fine. It is not garbled. When you go back to the map screen and watch the screen update on a station that is in motion and showing altitude fixes it does not update the altitude on the 3d map. I am running 6.7a. It appears that the posit rate when set to once every 10 seconds does not happen at 10 sec intervals. It looks like the updates occur at 30 to 45 second intervals.
Don't get me wrong I like the program, I am just reporting a problem that I ran across and wanted to see if it is something at this station or a real bug. Seeing that you are at PACCOMM would you know the difference in the 2 NEMA

0183 protocols in the 45 one says version 1.5 and the other version 2.0. One seems to dump alot more info out the port than the other.

re: Axioms switching

I wasn't worried about both applications talking to the port at the same time
as with event based programming this could be handled I'm sure. I am,
however, what (if anything) it does about incoming information from the
serial devices connected. I know for sure the modem & tnc want to send info
to the computer, and most printers do too, so what if one wants the
computer's attention when it isn't cued up?

<<
REPLY TO THE ORIGINAL ORIGINATOR TRYING TO SEE HIS OWN PACKETS: I think of your own outgoing packets as a nuisance that take up processing time. If your PC is fast enough that you never see I/O GLITCH errors in the upper right display window in APRS, then I guess it is OK, but it tells you nothing. In fact, seeing your own outgoing via the DIGIPATER is FAR more valuable, since if YOU saw it, then it means you got through... and probably everyone else saw it to. If you let the TNC echo, then you will NOT have this valuable resource available to you to let you know that you are getting out.
>>

I would agree, except that listening to your packets via MXM might be valuable during trouble shooting, especially if you don't want to go on air while configuring/trouble-shooting.

don't have first hand knowledge of this product, but from what I had read about it, only one serial port could be active at a time. The software was smart enough to remember which program had used which port last, and use that the next time that program opened a serial port. I had investigated this device when I was looking for a solution and found that it would not let me do what I needed. I could be wrong though.

I saw a message a few days ago about a shareware app that allows data dumps from the GPS-45 to the Mac. Being isolated out here on AOL I have no access to the internet or this file. Is there anyone out there that has access to this file that can either send to me on AOL or post it on AOL (I was surprised it's not there) for us guys in the sticks?

I'm also interested if this has been tested with the GPS-75 as well? Garmin says that their PC program is the same for the 45 & 75's so I would "assume" this will work on both.

I'm also looking for info to interface my GPS-75 into the Mac/ APRS for my big summer trip to the great North this summer.

Next I gotta send in my cash so I'm "legal"!

Tnx, Jeff - WA6EQU

We on AOL have limited access to the Internet. While not total, we can do alol. Type Keyword "Internet" to see. The APRSSIG is on the Internet.

Bob can correct me if I'm wrong, but the "thousnads of lines" issue is an indication that you are already at the limit of of reasonableness in a map segment, and then push APRS over the edge.

Bob increased the number of lines and points a couple of rev's back, (thanks! doing detailed 1:100k maps was painful before then) and I saw that a whole lot.

Drop me e-mail and I may be able to help you with the mapfixer questions.

Two problems going to 6.7a - wonder if anyone else has experienced these and have any constructive comments?

1. Cannot save digipathes anymore, no matter what I try. Seemed to work with earlier versions. Every time I fire up a new session, I have to input the several pathes I use all over again. Is this is bug or have I forgotten something?

2. Suddenly 6.7a will not work full screen under win 3.11. Every previous version did. Even playing with pif's doesn't help. I get init of tnc, then screen freezes. FUNNY THING...!!!! If I run from a dos c: prompt UNDER WINDOWS it works fine. Have tried everything, video/port/etc. conflicts and can't find anything that might cause the problem.

Worse comes to worse I'll have to go back to 6.6.

Oh yes, save the wisecracks about windows, ok? tnx :)

Thanks for any helpful comments!

Those that think that the requested shareware fee is too high, obviously have never tried to write computer software. The author has worked long and hard to design, code, debug, re-design, re-code, debug, ... ad infinitum. He has most definitely earned whatever minimal fee he is asking for. If you think it's too high, then go write your own!

302. Kantronics Plus tnc

From: Bradley Lee Ambers <brad@ecst.csuchico.edu>
Date: Thu, 30 Mar 1995 09:47:08 -0800 (PST)
To: aprssig@tapr.org
Message-ID: <Pine.HPP.3.91.950330094109.16573A-100000@steroid.ecst.csuchico.edu>
Rendered body type: text/plain

I am running APRS ver 6.7a with a Kantronics Plus. When I try to switch from VHF to HF by using the 'C' command then typing 'HF' all indications on the screen say I am in the HF mode. The top right hand corner of the screen says it is initializing my tnc and the command bar at the bottom says it is in the HF mode. But when I xmit a packet it xmits on the vhf port yet and no matter what I do I am unable to get the darn thing to xmit on HF. I can verify its xmitting on VHF by watching the light on the kam and my xmit indicator on the VHF rig lights and the HF does not.

Can someone out there help me out this is driving me nuts.

One more item...has anyone succeeded in running APRS in the background of the windows enviroment? If so how did you do it?

Thanks for the help in advance. 73's

Brad

Rendered body type: text/plain

I would say that you are correct. You are setting the HF port and not the VHF port. On the KAM, the UNPROTO command is like this

UNPROTO APRS VIA HF1,HF2,ETC / APRS VIA VHF1,VHF2,ETC...

That caommand sets BOTH the HF and VHF ports separated by a slash character...

304. Re: [APRSSIG:503] Re: DXF to Map?

CONCERNING THE DXF MAPS:

There is a guy in Marion OHIO that has developed a complete set of tools for making APRS maps using AUTOCAD. He can convert AUTOCAD maps to APRS and APRS maps to AUTOCAD. Look in my README\MAPS.txt for the info on where to get a hold of him. I believe his call is KG8GE. His street level maps of Marion Ohio are EXCELLENT. But they are in the OHmapsxx.zip file, not normally distributed with APRS.

Since he spent about a year developing these tools, he is asking for a small registration fee. I think it is \$25 or so...

305. Re: [APRSSIG:504] GPS 45 and APRS bugs

Rendered body type: text/plain

Concerning the guy who is not seeing ALTITUDE but about 10% of the time...

APRS looks for GLL, GGA AND RMC. If it sees RMC before seeing GGA AND VTG, it will use the RMC sentence. If it gets a good RMC, then it will stop looking and THERFORE NOT get the GGA. Withoug the GGA, you wont get altitude.

I suspect that your GPS is outputting both GGA and RMC. YOu need to turn

off RMC from your GPS if you want to guraranteee getting GGA everytime...

Many GPS's give you some selections on what sentences are included in the NMEA output. Check your manual...

Yea, I know it does, but gee, he wrote the program. The way I see it, after looking at a lot of maps made in Autocad, it would end up like making maps with the USGS CD-ROMS. Very time consuming.
I'll stick with my old pen and paper plots.

TWO people have now reported that they CANNOT save the 13 digipeater paths anymore in version 67a.

I tried it ON MY MACHINE using 67b (no changes to that portion of 67a) and it works fine...

ONE guy said he could not even get it to set up any paths using the OPS-DIGI-choose a path function..

The second guy says that the 13 paths are NOT reloaded each time he starts the program...

These sound like two separate problems to me.... BUT NEITHER IS A PROBLEM ON MY 386/486 PC's.

ANYONE ELSE CAN CONFIRM THIS/THESE PROBLEMS?

CONVERTING THE GUY TRYING TO CHANGE THE KAM BETWEEN HF and VHF:

APRS uses the default |a to change to VHF and ~a to change to HF. Be sure that you have not altered those commands for your TNC. I don't remember the names of the commands for changing these stream/port switch characters... But be sure they are still | and ~

Once you verify that, and it still doesn't work, get back to me...

I have uploaded the MacGPS_45_v0-1.sit to the APRSSIG upload area. It took a very long time to get across the net from .au
My new LCD modes was showing 125 CPS most time I get 1712 CPS

Rendered body type: text/plain

Hi Bob,

First wanted to inform you that Boyd, W2HOB, is now among us here on APRSSIG, he internet address is W2HOB@aol.com

I have found two problems with 6.7a, one of which was reported to you by someone else and I just verified it..

First, the one reported, storing the digi path into the config file.. 0 - D - S - (what you want), sorry I believe that last character should be a "v"

since it is uppercase in the ListsaVe.....The other gentlemen is correct, it doesn't save the Digipath.. (v6.7a).

The other problem I discovered is that it will not save, per SETUP a map range of 128 miles.. Lets put it another way, it saves it as 128, verified in config file but when you reload APRS it is defaulted to 64 miles.. I have also checked saving set-up using 32, 64, 256, and 512 mile ranges and all those worked! Only one that loaded wrong was the 128 mile range. (v6.7a)

My APRS is running on a 286....

314. Re: Video problems under windows

From: dhenders@InterServ.Com
Date: Fri, 31 Mar 95 03:43:52 PST
To: aprssig@tapr.org
Message-ID: <9503311143.AA15623@ InterServ.Com>
Rendered body type: text/plain

For those of you running APRS under windows here a few hints and kinks on video problems that might help solve some problems. Unfortunately, depending on your hardware and video drivers there may not be a solution to your video conflict.

The first thing to understand is, that in this new world of video accelerators, manufacturers have been using broad areas of memory. Blocks of memory that used to be reserved for (or permitted to be used by) DOS (in the days when DOS was the only thing going) have been overtaken. Crys of distress have been heard from both sides of the programming street. So, video problems using DOS applications under Windows can be frustrating and unsolvable.

Do these things in the following order and try running APRS after each one to see if it solves the problem:

1. Many video card manufacturers are using memory areas a000H to c7ffH. If you have a video accelerator card, try excluding these areas of memory from use by the system and Windows. Do this by adding the following at the end of the EMM386 line in your config.sys file: x=a000-c7ff
2. Make sure you have defined a PIF file for running APRS. Have the following set as checked blocks in the PIF file: (First page of PIF editor)--High Graphics and Execution Background. (Advanced page of PIF editor)--Lock Application Memory, High Graphics, Emulate Text Mode and Retain Video Memory. Change both Memory Requirements blocks on page one of the PIF Editor to -1.
3. From the DOS prompt (not in Windows) check the Mem command and make sure that you have more than 500k of conventional memory. If not run Memmaker and try to get your system configured for more conventional memory.
4. If you have a special driver for your video accelerator card trying using the VGA driver supplied with Windows. (Do this only if your video card manual says that the original drivers supplied with Windows will still work with the card.) This option is your last resort, your accelerator card will not be up to speed using the Windows driver but the video lockup and unstability may disappear using the Windows driver that doesn't do all the

fancy things in memory. With a small amount of effort (when needing the acceleration for Windows graphics applications) you can switch the custom driver back online. Then switching back to the VGA driver when running APRS. (No fun but effective.)

If you got through paragraph 3, and you still have video problems, then unless your video card manufacturer has an updated driver you'll have to be satisfied with paragraph 4 if it works.

Video card manufacturers are learning how to get around these problems by designing drivers that overcome these DOS video problems (hint to Microsoft and others) and DOS programmers are learning not to do things with video that encroach on the newly reserved video areas (hint for APR).

If you just want to throw your hands up in the air and not do anything. That's alright too. Windows 95 will ship in about 4 months and it solves all these problems! Or so I've been told.

Question: Does anyone out there have a beta of Windows 95????

Have fun, 73, Dave, N3EOY

Hi Jeff:

Don't use their search list. Pick (something like) "Enter FTP site of your choice" and enter "ftp.tapr.org". I know they don't phrase it as I show but it's close parallel wording.

Good luck.

Rendered body type: text/plain

I am running 6.7a on a 1MB 286 and have NO trouble storing and retrieving digipeater path information via the O-D functions.

The only anomaly I see every now & then on 6.7a is a line that looks something like the following appearing somewhere on the map:

'TRACK-HISTORY=XXXXXXXXX.XXX'

Ed - W9KTH

317. Re: Welcome plus 2 Problems

Rendered body type: text/plain

K2ADJ reported that the CONFIG file will NOT save 128 mile range but defaults to 64 miles!

RESPONSE:

Thanks for the 128 mile problem, I have noticed that over and over, but just assumed that I didn't remember what screen I was on when I saved it! That EXPALINS IT! (But I don't know how that is happening)

I tried 67b again last night and still the DIGIPATHS save works fine...

I didn't change anything between 67a and 67b (that I know of).

So if anyone that is having probs with the DIGI paths in 67a and can eventually test 67b, please let me know if there is a difference or if the problem persists.

318. MacAPRS 1.4.2

From: Keith Sproul <ksproul@hardees.rutgers.edu>
Date: Fri, 31 Mar 95 9:54:31 EST
To: aprssig@tapr.org
Message-ID: <CMM-RU.1.4.796661671.ksproul@hardees.rutgers.edu>
Rendered body type: text/plain

MacAPRS 1.4.2 is now up on both UCSD and TAPR ftp sites..

Note: the UCSD site is MUCH faster, However, I have less control over what stays there and sometimes the stuff gets deleted

The MacAPRS.other.sit file is now on both sites also. This contains the SERIAL TOOL, the Documentation, and a new file, MacAPRS.History.

This History file contains all of the revision announcements, and therefore has some stuff in it not in the documentation yet..

Speaking of documentation, I have a person locally working on updating the documentation, so that should be shaping up soon.

Also, for those of you running System 7.5, we are working on a MacAPRS AppleGuide document.. If you have Sys 7.5 this will be quite nice..

Rev 1.4.2

This is a minor release that fixes a couple minor things.

* There was a memory problem if you ran out of memory, in some cases, it would not re-claim the memory correctly.

* There was a minor problem in the CALCULATE DISTANCE dialog box that has been fixed.

* There is now a TRACKED STATION LIST that shows all of the stations that are being tracked. This station list works just like all of the other station lists but has data applicable to moving stations. One thing of interests that has been added to this is the actual distance that station has traveled. This is point to point distance, NOT line of site distance.

* The MESSAGE ACKs have been reduced so that it will only ack once in 30 seconds. This is because the old way, it would ACK every time it saw a message, even if it was being digi-peted around..

* Some more work has been done on the BALLOON stuff, but it is still not finished... Contact me if you are interested in the Balloon features.

It seem to have gone unnoticed in this discussion, how many maps of
this world are available in DXF format.Basically every serious mapping
software can export a map in DXF.That means, just about every government
office,utility,oil company and you name it can make their maps available in
DXF.Those maps are usually precision maps and very useful.I tend to think
that nobody would have to make their own APRS maps anymore once people would
start tapping into the enormous map database out there.I sure like to have a
copy of the DXFtomap program and gladly pay \$25 +.

Yes, there was a problem with the storing of the Digipeater Paths but in reality there is no real problem, only that you have to perform another function..

When you O-D-V and SAVE the different digipeater paths, when you O-D-L you will see them all as you saved them BUT they are stored ONLY in RAM, not in any file!

For you to use them again, lets say tomorrow, you MUST use the ALT-S to save them (Digipath list) to the config file. YUP, it works....

APR REPLY: G0od thought. To save the digipath you use the O-D-V command , but that is only temporary. You must do an ALT-S-SAVE to re-save your config file before those DIGIPATHS are REMEMBERED...

> a mile or two at 60 MPH.

APR COMMENT: Could be related to problem below. If the data was garbled with a colision with incomming TNC data, then APRS "GOT" the NMEA data, but then threw it away because it didnt look right... That may be the missing posits. Garbled colisions would surely show the I/O glitch warning.

> Occassionally I see some TNC data intermixed when in OPS-COM-GPS screen

APR COMMENT: You do not have the TNC handshaking properly. Be sure that you are set up for hardware handshaking, and that your TNC does use DTR to hold off data. PACCOMM TNCs use RTS... Looks like I should force hardware handshaking mode when in HSP. I believe the command is XFLOW OFF.

Jack, what was your path? W,W,W? or sis you modify it as you go? When I got home, I had a continuous plot of your trip from Vienna to Philadelphia and back. (then I got to keyboard dancing and lost it all!) So I didnt get to see what paths you used. NOTE TO EVERYONE ELSE, the eastern seaboard from central VA to Connecticut has 12 WIDE digi's. F0rtunately, I live in about the middle, so even with W,W, I probably could see everything..

I reworked the HSP switch completely. It may have helped the "glitchling" messages, but I still seem to be having some problems.

After testing again, I'd characterize the problem as follows:

With P-rate set to 10/37, I see APRS toggle for NMEA every ten seconds, and most of the time, immediately see "Got good NMEA fix". Very occasionally I see NMEA glitches but they are usually followed immediately with "Got good NMEA fix".

The problem is this - frequently I do not see the posit updated on the map after the "Got good NMEA data" message, even when moving along pretty fast, even with a seven sat GPS fix, even with the GPS-45 showing data continuously updated, in other words, no breaks in GPS coverage and plenty of change in location from the previous 10 second NMEA poll. I've seen it go through over four minutes of 10 second polls with no update to the screen, after travelling about two miles - all the while giving "Got good NMEA fix" messages (with an occasional glitch). APRS interprets this as still being in the same spot, and the decay rate multiplies every time it XMITs until the interval changes from 37 seconds to over seven minutes. Eventually the posit on the map gets updated and things recycle from there.

I'll check that out. This is an MFJ 1278BT. I think I may already have hardware handshaking enabled. "Normal" hardware handshaking uses RTS/CTS, at least that's been my personal experience in the dialup modem world. DTR is usually used (in dialup modems) to tell the modem to go on-hook. So, do you think I should try changing things around?

>Jack, what was your path? W,W,W? or sis you modify it as you go? When I

>eastern seaboard from central VA to Connecticut has 12 WIDE digi's.
>Fortunately, I live in about the middle, so even with W,W, I probably
>could see everything..

I was using W,W until Joppatowne, then went APR-11,APR-1,K4LV,N4ULS,WD4HDL-1. When I got to the Audubon/Mount Laurel area, I used N2FET-15, N2IPH-15, APR-11, APR-1, K4LV, N4ULS, WD4HDL-1. This worked great for folks back here in Vienna - I played my HST back when I got home and it showed good coverage back to Vienna with a big hole between the MD-DE line and about 20 miles into NJ, but solid performance with the N2FET-15...WD4HDL-1 path.

Video problems solved (video driver problem, simple in retrospect!!!!) BUT
still having the same save problem with the digi paths in 67b.

Remember now I have no problem saving or listing the pathes **within** a
session, the problem is only when closing a session and trying to save the
information, and bring it back into a new session.

Wish there were some kind of "cfigdigi.dat" file that would be created when
you save stuff before closing out a session!

Oh well, what do I know! Thanks very much for the followup.

Rendered body type: text/plain

Hello Bob - APR,

I keep seeing questions and suggestions concerning using several types of setup/config files. I have always wanted APRS to do two things.

First, save ALL parameters that can be customized via menus in a config file so if I do not want labels, borders or roads to come up I do not have to reset them every time I load APRS.

Second, use the previous config file to update the new config file when upgrading versions.

I think a config file structured like a Windows INI file may do the trick. This would eliminate having to put each parameter on a specific line number in the file. It could look something like --

```
[mapcmd_features]
all=on
borders=off
calls=on
dim=off
headings=on
labels=off
etc...
```

```
[controls]
bcns=on
dx=off
fade=on
hf=off
log=off
etc...
```

```
[digipaths]
o=wide,wide
e=wb4apr-1,wide
w=wd4hdl-1,wide
etc...
```

```
[restore_tnc]
be=off
etc...
```

Notice how I structured the [groups] around the menus.

APRS could spin through the file when it loads and set the parameters accordingly. When someone installs an upgrade and the INI file already exists APRS could use, insert or delete whatever parameters it wants.

Sure would make my life a lot easier and the config file would make sense when you looked at it.

I understand this method may not work with the way APRS is coded but it would be a nice feature if practical.

Anyone else like this idea or have a better one?

Kent

> four minutes of 10 second polls with no update to the screen, after

APR reply: Hummh. Pse tell me this. WWhen you are "getting good NMEA"
but do NOT see an update on the map, hit the space bar and see if the new
plot is posted. I need to know if the FIX is not getting recognized, or
more simply, the new fix is simply NOT getting plotted until the next
packet goes out.

ANOTHER test that would be useful, would be to hit the P-LIST every 10
seconds and see if the posit is being updated, but just not displayed...

> least that's been my personal experience in the dialup modem world. DTR is
> usually used (in dialup modems) to tell the modem to go on-hook. So, do you

APR REPLY: I agree that many people use RTS, but after my 20 years of
messing with RS-232, I was surprised when I re-read the SPEC and realized
that the definition of RTS (from the terminal to the modem that says I am
ready to SEND data, actually has NOTHING to do with whether the terminal
is ready to RECEIVE data. Only the DTR line can say that according to
the SPEC. SO there we have the problem. The SPEC says one thing, and
a lot of folks have by default done something else (to save one wire)

APR REPLY: Since APRS is operating on a CSMA channel, the nominal throughput of such a channel is about 36% of total channel capacity. But since we use digipeaters and we have the ole' hidden transmitter problem which makes more collisions, the actual throughput is less. Therefore I assumed that the APRS frequency is 100% loaded when it is passing packets 30% of the time. If the channel was passing continuous packets (100% of original channel capacity) then you could see the APRS channel capacity go up to 330%!

But this is all theoretical, since if the channel is 100% busy, then you can also say that NOONE else is getting through. That's why if you are hearing packets more than 30% of the time, then there are a lot of stations out there that are NOT getting through (PROBABLY)...

6. QRP single freq HF rig

Rendered body type: text/plain

I have seen the ad for a 5 watt HF single band QRP kit for \$69. I was all ready to buy it, but they didn't answer the phone on the weekend, and by the time Monday rolled around I had lost the ad. IF IT WORKS, it could make a nice "under-the-seat" GPS tracking transmitter for the 10.151 MHz APRS tracking net.

It is NOT the separate RCVR, XMTR, and PA sold by RAMSEY... The unit costs add up to more than \$69....

No new posit is posted when I hit the spacebar, and the position in the P-List stays the same throughout. I notice the P-list says "Last NMEA fix". It's like it is reading the NMEA data and seeing the same position from the GPS every time it toggles. I guess I can play the NMEA data to see if it changes, but it moves too fast for me to see in OPS-COMM-GPS. It's possible the GPS could have a problem, but it is brand new, and maintains GPS lock the whole time this is happening.

I agree completely. As long as the DCE knows what you are doing this should work fine. If you toggle DTR on most dialup modems, they will go on-hook, terminating any active connection that may be up. They seem to be looking at RTS/CTS to control the flow of data.

Hello all... I'm new to APRSSIG, but not to APRS. I read with interest a comment from someone who thought it would be a good idea if APRS would save its configuration in a .INI file similar to WINDOWS so APRS would boot up exactly the way you would want it to.

I agree and have wanted to mention this to Bob, APR, but I am one of the great procrastinators! I think this would be invaluable for applications such as a standalone receive-only terminal at a place such as the NWS/NOAA office where forecasters may be watching amateur radio/SKYWARN reports... if they lost power or took any glitch and found it necessary to reboot their computer, it would come up in exactly the configuration they wanted it to be in.

How about that Bob... any possibility this is feasible? 73 de Boyd

Gee Bob,
T U for the explanation. Now I feel better while understanding that no surepticious (sp?) messages are being passed.

Perhaps in the future (version 8.8c) you might consider adding a README explaining the more esoteric aspects of APRS (I'll say it for you: Hi, Hi). It's a great program Bob and, as you can see from the posted interest, it has wide application. Some of us (at least me) like to understand what is happening within the program as we enjoy its application.

regards,
KB4XE

Date: Sat, 1 Apr 1995 13:19:09 -0800
To: aprssig@tapr.org
Message-ID: <199504012119.NAA20778@hairball.ecst.csuchico.edu>
Rendered body type: text/plain

Yes, there was a problem with the storing of the Digipeater Paths but in reality there is no real problem, only that you have to perform another function..

When you O-D-V and SAVE the different digipeater paths, when you O-D-L you will see them all as you saved them BUT they are stored ONLY in RAM, not in any file!

For you to use them again, lets say tomorrow, you MUST use the ALT-S to save them (Digipath list) to the config file. YUP, it works....

Bob, this is basically the same problem that I am seeing without the TNC connected. I was out with just my laptop connected to the Garman GPS-45. I was the person who brought the GPS-45 problem to your attention concerning missing Altitude fixes.

Is there a possibility that the GPS-45 is sending too much data to the APRS program and possibly over running a buffer? I checked the the users guide and there is no mention of a way to select what sentences are output from the 45 or what rate the updates are output.

15. More on HSP problems

From: janderson@ram.net (Jack Anderson)
Date: Sun, 02 Apr 95 10:16:14 GMT
To: aprssig@tapr.org
Message-ID: <15021591.0a46@ram.net>
Rendered body type: text/plain

Bob,

I just completed some more testing with my HSP cable. I have a few more observations.

I did confirm that the GPS unit is sending updated posits in the NMEA data. Using OPS-COMM-GPS, I was able to track the lat/lon changes while in a moving vehicle, during a period where APRS was not updating the position even when getting "Got good NMEA fix" messages every ten seconds. I also confirmed that the 1278 was properly config'd for hardware handshaking. I even swapped the 1278 with my KPC-3, same thing.

This is beginning to look a lot like a timing issue. I assume that APRS "opens a window" at the specified interval to grab NMEA data from the GPS, then switches back to the TNC. What if the window is not long enough to grab ALL the NMEA data, just some of it, enough for APRS to think it got a good NMEA fix, but with no new posit data. The reason I think this might be happening is that I have noticed a pattern to the way it works and doesn't work. It will get four or five good updates and plot them on the map, then, for the next 1-4 minutes, report "Got good NMEA fix" but not update the map or the P-list. If observed long enough a fairly steady pattern becomes apparent. It's almost as if APRS goes in and out of sync with the NMEA data coming from the GPS. Sort of like this:

```
HSP-----HSP-----HSP-----HSP-----HSP-----HSP-----HSP HSP toggles
LL-----LL-----LL-----LL-----LL-----LL-----LL NMEA L/L trnsmsns
**                      **                      **                      ** good L/L captures
```

Now, not knowing how APRS handles this, I might be wrong, but this is what it seems like is happening.

Jack

ANSWER: APRS already comes up from a CONFIG file in exactly the mode you want it. Am I missing something?
The only issue that I have heard of is having to RE-CONFIGURE each time the user starts up a NEW aprs version with a DIFFERENT config file format.

17. PK-12 with Standalone mode

I have received an updated EPROM for the good people at AEA. This problem solves the problem with the course and speed from a mobile user.

Now, all the DOS users are getting a course and speed vector, but the people with the current version of the Mac software are not.

If you are using a PK-12 in standalone mode, then you should get a new eeprom from AEA. As far as I am aware, this is the only problem the update addresses.

(BTW, it seems as if my subscription to this sig was deleted. Is there something I have to do to "renew it"?)

The PowerPC version of MacAPRS 1.4.2 is now up on both ftp.tapr.org and ftp.ucsd.edu.

If you have a PowerPC, you REALLY should get this version! It is FAST!!

Also, if you DO have a PowerPC, and DO get this version, please let me know.

Config file like the "*.ini" files in windows..

What the gang is also refering too Bob is the fact that when you load up the system and the map is displayed, all those things you do for your likeing, such as What you want to display, such as Labels, callsigns, types of objects you have to do it every time you bring up APRS, the reason being, when you set up the system to the way you want it, then ALT-S-SAVE, those other things like labels, callsigns, tint, object in the just-one...etc ARE NOT SAVED TO the present config file.

Are you sure of that freq. (145.39). That is a repeater output freq.

I think you meant 144.39. Unfortunately for the satellite people that is an Oscar freq.

Well, Bob, the "default" booting I was thinking of is something like:

MAP-FEATURES-DIM
MAP-FEATURES-CALLS (OFF)
MAP-FEATURES-LABELS (OFF)
LOGGING OFF
DEAD RECKONING OFF

Right now, I must turn each of these features on or off when I boot APRS.
Yes, I know the program boots from the CFG file of which several could be kept, but some of the features above default to ON conditions. The program does remember BEEPS on or off!

Have I missed something or has 6.7b included my wish list above?! I really need to sit and read the latest docs!

I can't seem to mark large areas on the map in 6.7a. I used to be able to draw a large colored circle after hitting: home (the center of the circle) and then moving the cursor to the edge of the circle I wanted. I would then hit: I,A,<CR>,<CR>,test1,0,A,C,Y,10,<CR>,<CR>,Y
This no longer seems to work in version 6.7a (snivel,snivel). Suggestions?

Hello Brent,
I haven't found any other problems with the PK-12 yet, as I have been
using it ONLY for GPS. As far as I have heard it works fine for all
its other features. The fix only affects course and speed when you
have a GPS plugged into the RS-232 port. Nothing else (there was a
CRLF missing between the \$GNMEA1 sentence and the \$GNMEA2 sentence.)

oopsss it is 144.390 MHz,

Which satellite does that affect? I thought it most of the satellite
downlinks were in the upper 145 Mhz (ie: AO-13 beacon is at 145.812,
and RS-10 is at uplinked at 145.910-145.950)

Cheers....mike

> O-C-G, it seems to be spitting out the following sentences:
>
> RMC RMB GGA GSA GSV GSV RME GLL RMZ RMM RTE

APR REPLY: And NOW WE SEE THE PROBLEM! Notice that APRS looks for RMC,
GGA or GLL and then looks for VTG. In the case of the GARMIN GPS-45
which outputs all of the NMEA strings above, APRS gets an RMC, then a
GGA, and then while still looking for a VTG (there is none) it begins to
get the GLL. Since it uses the last one obtained, there is a good chance
that it is halfway through parsing the final GLL when the 2 sec timer
gives up on the VTG, which then switches back the HSP. APRS sees an
incomplete GLL or whatever, and aborts the whole thing... resulting in no
POSIT.

THE FIX: Simple, I will just make APRS look for RMC, GGA, and GLL in
heirarchical order. Once it has one, it will NOT continue to accept
additional ones while waiting for the VTG. This FIX will be in 6.8 along
with a new READ MESSAGE screen that keeps MESSAGES OFF the map. This
will keep the map from getting trashed with messages...

APR COMMENT: In trying to find a universal tracking frequency, it is recognized that there will be conflicts with 145.79 in some areas. But the advantages of a SINGLE continent-wide GPS tracking network will be significant. We are only just beginning to see the tremendous potential of this capability.

My recommendation is that 145.79 be used WHEREVER POSSIBLE, and that exceptions be made on a case-by-case basis. Why put all of CANADA on a different frequency, when only 2 cities have the problem?

In just a few months you will begin to see crackerjack size trackers and all will be XTAL controlled. Remember we are talking about MOBILES, and mobiles do travel. AND the further they travel the MORE IMPORTANT THE TRACKING (usually). Do we want everyone to disappear from GPS tracking systems when they cross the CANADIAN border? Going either way, it's the same...

Yes, many people are using synthesized radios now, but as the GPS tracker becomes an imbedded device used as an everyday appliance, the use of a \$350 radio where a \$99 one will do, will fade away.

I am very pleased to see the effort and results of being able to declare a national CANADIAN GPS tracking frequency, but I would ask that the long term effects of such a commitment be seriously considered...

Bob,

If I understand WA2TQI's problem, I think it is something we saw in our TNCs some time ago. What we found (and fixed) was something generic to TAPR TNC code which kept the async serial port from being able to copy all of the GPS output, which is quite voluminous as he observes.

The TNC normally gives interrupt priority to the RF port (so it won't miss frames like the GLB 'software HDLC' TNC used to do) based on the idea that a person is inputting characters from a keyboard. When faced with a continuous rush of input on the async port and no flow control, there are numerous overruns and corrupted data.

One tip for the MFJ would be to upgrade to 10 MHz CPU clock speed so that there is more processing resource...

Hi All:

If I want to get range and bearing on small-scale maps I've no problem, say up to about 100 miles. But when I was talking to a ham in Nova Scotia a few days ago I wanted to know range and bearing the software (v.6.6 at the time) wouldn't do it. I've checked long-range bearings several times and the program wouldn't do it.

Is this a bug? Cockpit error? Another incidence of RTDM (Read the Damn Manual) ?

Marvin,
I don't know of any "plan" in SoCal for APRS, other than by default we have been using the VHF packet repeater on 146.745 (-600) since it sees little use otherwise. There are only 3 or 4 of us there, and that varies.

Marvin,

Share whatever you find with me. NW6H says that the "other packet repeater" (not WB6YMH on 145.36) is being used for APRS. The Orange Book says that is 146.745(-). I haven't got APRS on the air yet, although I have run it.

APR REPLY: Thats a big problem. Since there is NO standard freq in LA, then the users cant find each other, and no one knows the others exist. There are a number registered, but all claim that they cant find anyone else... Good luck. If 145.79 is already in use out there, and you cannot negotiate a shared arrangement, then good luck. Once you get a freq, post it here, so we all know the answer...

I agree with Bob.. If you don't do the spherical trig, the errors get SO large that it isn't worth doing.. Therefore, I put the full spherical trig for this into the Mac version.. You can find distances between any two points in the world.. Even spherical trig has some errors in it due to the fact that the earth is elliptical and not spherical.. I even have some of this in the Mac version, but that is more in the conversion of other types of map data..

These distacnce calculations have proven to be so useful, there is a DIALOG box that you can enter any two items, stations, airports, zipcodes, gridsquares, call signs (if you have the Buckmaster CD) or any combination of these, and it will tell you the distance and bearing between them..

Please don't tell me that the ARRL bandplan makes it look "OK." The ARRL has taken very little responsibility for frequency coordination, stepping aside, rather than stepping up, when the FCC wanted them to be the body to recognize frequency coordination bodies across the country a couple of years ago. The bandplan they recommended was nothing more than a recommendation, and came out well after Southern California and Texas had published their plans, with different "recommendations." It completely ignored common practice in 2-way communications in looking at coordination, and drew precious little from published standards (Ca. and Tx) at the time.

I agree that we need some coordination of a channel but I seriously doubt that 2 meters is the place for it. I may well be that we have to negotiate some of the weak-signal or experimental space on UHF or 220 MHz. Matter of fact, if there had been more 220 MHz activity, we might still have it. 2 meter spectrum is scarce and getting more rare!

I HAVE considered the effect of a "nationwide" or "continent-wide" frequency, and realistically, it's not likely to happen. A group of frequencies, linked by HF or dedicated UHF links between areas, however, is practical. So the radio is crystal controlled. Sorry guy. That's not necessarily consistent with reality in today's spectrum.

Bob,
I couldn't agree more on a single frequency. I will pass on your
request to VE3DSS, Dana and ask that he consider the above. I'm not
sure why we picked that frequency, but I will see if the above can be
used as it is marked as digital usage.

I'll keep you informed...

cheers...

There are a few of us that are working on obtaining some additional frequencies for packetters in SOCA. At this time the SCDCC, Southern California Digital Communications Council, has undertaken an indepth review of digital frequencies. At their last meeting on 25 March a proposal was submitted and has been forwarded to the Coordinating Bodies for their review and hopefully approval. One of the frequencies involved is 145.790. All interested individuals should make their desires known and if possible attend the next SCDCC Board Meeting on April 29 at 1130 AM, immediately following the TRW Swapmeet.

50. LOW POWER National Tracking Frequency

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Tue, 4 Apr 1995 09:50:05 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950404092134.2774C-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

To clarify the air on my proposal for a NATIONWIDE tracking frequency...

Please do not think of this as a power play. I am NOT encouraging the dismemberment of anyone's frequency plans, nor the displacement of any existing users on the two meter band. hi hi

I'm only suggesting a single frequency as a target, so that areas where it is available, can choose to use the same frequency as other areas. IF it's available, grab it. If not, find a different freq and let us know.

My only comment about the Canadians was asking why put the whole country on a different freq just because of conflicts in two cities.. But then, I am not a Canadian traveler, and maybe the Canadians all travel East and West more often than they travel South. hi hi Of course, I am probably taking the Yankee perspective of Canada as a thin sliver of USA wannabees all crowded along our northern fence... (JOKE!) But if travel across the line is not so important, then a NATIONAL CANADIAN frequency is also a GOOD IDEA...

In fact, TWO national GPS frequencies is better than 10 or 20 or 30. So maybe those US cities with conflicts could investigate the 144.39 freq too.. ALTHOUGH I personally do NOT like to see packet spread into the low end of 2 meters... And areas considering same, should definitely check with their FRQ COORD bodies (and SAREX ETC) before jumping into the flame.

The way we ended up on 145.79 was that it was designated as an experimental frequency. GPS tracking seemed to fit that description just perfectly. Then, as it evolved in to a permanent system, we realized that the onus was on us to be good neighbors to the SATELLITE band starting at 145.80, and that was why the frequency was designated experimental in the first place.

You will see throughout my documentation and especially in the digipeater section, the encouragement to use LOW power transmitters at digipeaters. I see NO reason why any WIDE area digipeater should use anything more than 10 watts. The function of a WIDE digipeater is to HEAR mobiles.

Almost everyone that is LISTENING to a WIDE is a home station and has a good enough antenna to HEAR the WIDE.

SO I ENCOURAGE ALL GPS BASE (HOME or DIGIS) to KEEP THEIR POWER IN THE 10 watt class where possible. This will keep us as good neighbors to the ever GROWING satellite band. Consider the nice little MFJ 5 watt single frequency 2m packet radio for around \$100!

P.S. Remember the "target" frequency of 445.925 on UHF too.. See UHFfreq.txt (although I still have no reports of anyone there yet..)

Sounds good to me, and please forgive me if I sounded a little too strident yesterday. Aside from getting hit pretty hard when I talked to the Texas VHF-FM Society, I got a little sensitive with some other packet issues for SAREX a while back.

> In fact, TWO national GPS frequencies is better than 10 or 20 or 30. So

Exactly. We need some place where linking stations can also coordinate the plans, so that there is a mechanism for getting the data around. One possible method is encapsulated ax.25 via the internet, similar to that being used widely now in the NOS code. Gotta think on that one... But let me reiterate the need to work within the confines of local coordinating bodies, and not just claim a frequency without some coordination: There just might be things going on there you aren't familiar with.

> You will see throughout my documentation and especially in the digipeater
> section, the encouragement to use LOW power transmitters at digipeaters.

> I see NO reason why any WIDE area digipeater should use anything more
> than 10 watts. The function of a WIDE digipeater is to HEAR mobiles.

And, further, if you use a good receiver, with a good front end, you'll hear more of the on-channel signals and less of the intermod. That'll help too.

> P.S. Remember the "target" frequency of 445.925 on UHF too.. See UHFfreq.txt
> (although I still have no reports of anyone there yet..)

I personally feel UHF is a better place to go. Unfortunately, 445.925 is the OUTPUT of a repeater (designated "backyard" or low-power/low altitude repeaters) in Texas... So, we're still looking. All in all, 145.79 has been used pretty widely down this way. But I got jumped pretty hard for even asking about "another" packet channel, since the packeteers have not been particularly good spectrum neighbors down here!

APR COMMENT: Are you sure it is LOCKED? It should only be LOCKED into that HSP mode for 2.2 secs max (even tho the "toggle etc "message remains until the next 5 second cycle overwrites the new TIME

> Another observation - O-C-G sometimes takes a second or so before it fully
> kicks into HSP mode. When this happens, I sometimes see a couple of screen
> flashes with -I/O Glitch-

APR COMMENT: This is normal in OCT mode. During normal HSP switching, however, there is a high probability of switching in the middle of a bit (which triggers the I/O glitch). So APRS 1st CLEARS the comm buffer to make sure it starts fresh, and then waits for NMEA data.

> I'm still seeing GGA and GLL mixed in my
> POS: line. I also notice that I don't get course and speed related plots
> unless I use NMEA 1.5 instead of 2.0.

APR REPLY: Whoaah! You didnt tell me that you had any choice between 1.5 and 2. You said all you had was the I/O selection! You gave me the list of NMEA strings (I assume in 2.0 mode) tell me whats in 1.5 mode? (Im sure it has GLL and VTG and NO RMC)

53. APRS - Delorme Rockwell GPS

Bob -

I acquired the shareware copy of APRS at the Vienna Winterfest. I recently acquired Delorme's GPS Trak n' Go which uses the Rockwell NAV OEM GPS chip to interface with their CD-ROM maps. The Rockwell chip, as you may know, uses a binary data stream, not the NEMA ASCII.

Paul Evans at PacComm suggested you or Keith Spruill might have the data format used by Rockwell. Paul believed Keith had used the Rockwell format for the Mac implementation. Do you have any info on using APRS (or PPRS) with the Rockwell chip? Do you have an email address for Keith? Any help on getting me up to using the Delorme product with APRS without having to buy another GPS unit would be most appreciated.

Thanks in advance,

Ken Bass

It seems locked. There is no response to keyboard commands, but they do seem to be buffered, and are processed when the TOGGLE is finished. Most of the TOGGLES last (what seems to be) less than one second, and are followed by Got good NMEA fix. The long one is also followed by Got good NMEA fix. I usually don't see the new TIME display until after the Got good NMEA is displayed.

>APR REPLY: Whoaah! You didnt tell me that you had any choice between

RE: Rockwell GPS format..

Yes, I fully understand the Rockwell binary format.. No, you don't want to mess with it, especially now since Rockwell also makes NMEA stuff.

The Rockwell is wierd binary, non-standard, and has to be converted. It is fully implemented in the Mac version, but I don't think that does you any good.

We can continue any other discussions direct and not on the SIG..

Hi all,
I have a little problem involving an aea pk-12 tnc and the aprs program.
I got a shareware version (64b) at a hamfest and it seems to work fine.
A friend got me version 67b off of a bbs and I sent off for a registered
version. Long story - short: I can't seem to get the share version of
67b or my new, registered version of 67b to work. There are about 3 of
us in my area using it on 145.79 and when I fire up either 67b, I'm all
alone. I can see their info coming across the bottom of the screen but
they don't pop up on the screen. And, when I send them a one line message,
they get it but my screen doesn't respond with the *ack. They see me, I don't
see them. Then, if I get out of 67b, load 64b and run it, everything works
fine. I've changed the monitor parameter to 4, mto and mfrom to all and
it doesn't help me on 67b. Anyone got any ideas that I might try?

Bob - Do you want me to go by the old homestead one of these days and
take some pictures for you (outside of Macomb)?

I just posted another BETA68B.zip Notice that this BETA..B supersedes
BETA..E.zip. Again, until the SYSOP moves it from the UPLOAD directory
to the APRS directory, you will find it there. This is of course on the
410-280-2503 BBS.

This BETA test is trying to get HSP to work well with the GARMIN-45 or
other GPS that outputs more than one GGA, GLL, RMC, VTG sentence.

I dont think I improved anything in this BETA..B over the BETA..E, but I
added a lot more display in the upper right hand corner so that you can
see better each step of the HSP process. Lemme know whats going on!

I have been a member of the Texas VHF-FM Society and AMSAT
for over two years and I have looked at the frequencies
supplied be each organization.

This is all I could find.

Texas frequencies

```
145.775 New AMSAT Los Angeles Wed 0400z CA FM Simplex
145.790 Link W.Texas Connection WTC/LNX San Antonio TX FM Simplex
145.790 #####
145.800 Satellite Sub-band start 145.800 to 146.00
Oscar-13 beacon is 145.812
-----
445.250 Link SW-texas Lynx System LNK Abilene TX FM Simplex
445.250 TV Cable Ch YY
445.925 #####
446.000 Texas R.A.C.E.S. Emg Nets TEXAS FM
```

I have not received any signals in Dallas, APRS or other wise on 145.79

Curious I had the same problem but with version 6.6!

I started with 6.2a, and it worked ok. I got 6.6 from Bob and WHAM no
other station icons on screen but me! Now I'm using 6.7a and it is
working fine (at least that part).

While I'm here....I do have a small problem. I'm using a locally produced
map (Boston, Mass) and all is fine so long as I stay within the map. If I
zoom OUT past the map, then zoom back into it, the labels are all
corrupted. The highways, city names and so on are undreadable.

Anyone else have a similar problem?

Several others have had this problem...the chip is coming configured
7E1...so make sure you talk to it the first time in that mode then you can
set it to 8N1 one if you like.

The first few that wernt out didn't have the hint sheet attached.

Hope that helps.

greg

There is minor activity on 145.07 in the Santa Clarita Valley and on into
Ventura area. I can see clear into Orange County from my QTH (34x 26' 23.8"
/118x 29' 08.4" W) and hear nothing else. As soon as W6JW implements store &
forward without FBB, I'll be there full time (jab-jab. . . U there Jim?).
Till then the TNC's on .03.

When a real channel is decided upon, I think there will be considerable
interest when the blips start showing up.

I had a similar problem with my trusty old PK232 and tracked it down to the way the headerline is parsed. Everything worked fine if we all worked through a digi, but for stations using me as a digi, they did not show up on my map, nor did I get the *ack.

The problem was solved by turning the digi display in the headerline off: MRPT OFF for my AEA.

With MRPT ON (which APRS forced when started), the headerline looked like this, for DL3SDM digipeating through me:

DL3SDM*>RELAY>APRS etc.

Now, it looks like this:

DL3SDM*>APRS

and everything works fine.

Am I correct that in parsing the headerline, APRS looks for the *> and takes whatever comes behind it as the destination?

73 from Germany (an APRS desert),

Sender: aprssig@tapr.org
To: brad@ecst.csuchico.edu (Bradley Lee Ambers)

ATTN: Brad, Kam Plus HF Gate ops.

Kam plus Reference Manual, Pages 22, 28, 31, 32. and my APRS @ ALLUSW
MSG 041400UTC APR 95. via Packet BBS System.

Set foll CMD's:

MYG... to GATE.. (MYG GATE) to close gate type MYG %)

STReam to \$7E/\$7C (~a / |A)

PORT to VHF

Status will read A/H Stream - I/O Disconnected

Also if ur in CMD: mode hit ~A for HF port to send. (SWIZZEL A or hit
|A for VHF port to send.) But in APRS just hit C-H for HF xmit, C -V for
VHF to xmit, but you'll get RED warning Box if Gate in ur Unproto path.

For HF set unproto to read: "GATE,WIDE/APRS VIA (local VHF digi)

For VHF set unproto just to your VHF normal Digi path.

If you are in VHF xmit mode and you have (GATE) in your Unproto path you will
get the Big RED Warning box.. Tells you why..

I was afraid of the traffic I was going to start when I mentioned the frequency coordination.

We have gone through quite a tirad in Canada about a new bandplan for 2m, 220 and 440. What we have found is the following:

The 2M spectrum is finite and at some point in time, there will be no more 2m spectrum that you can call your own. This is why APRS was assigned 144.390, and to the best of our knowledge there is no conflict with any satellittes, nor will there be in the future (who knows how long the future is...hi hi)

If APRS is looking for a national or worldwide 20khz frequency that they can call their own, it might be easier to use 440 (or even 220/440 gateways). I have a 2 watt Tekk radio that I use for 9600 baud packet (even at 2 watts) with great success. There is a few 9600 baud user ports even here in Toronto, so APRS could find a channel here that they could sort of call home. It might be best to do it now and avoid the rush (look ahead over the next 20 years and consider what has happened in the last 20 years).

If manufacturers want to build a small unit, then maybe this is the way to go. Just an idea. (I'll be glad to share all of the Canadian 200K of packet files that I have on the very heated discussions of spectrum).

Bruce,
I own one, and unless you can figure out how to get the NMEA data from it, I wouldn't recommend it. It is not a bad package, but not usefull for APRS and a TNC as I haven't found a way to get the NMEA data from it.

I've also seen corrupted labels on zooming up and then back in both with the standard maps as well as locally produced maps (I suspect the same ones you've got). I noticed this in versions prior to 6.7. I haven't seen in 6.7 though. My solution was to shut the labels off.

I've got 20 of 'em, and they work well. Even on cows. In a harsh environment. They're pretty rugged little radios, and inexpensive.

I suspect UHF is a good way to go. that's the path I'm pursuing here in Texas, because I already know what the chances of a statewide 2 meter channel really

are. But this needs to be done in the manner you did it: In conjunction with a recognized frequency coordination body, and not by a suggestion in print that "I think this is a nice chanel!"

> If manufacturers want to build a small unit, then maybe this is the way to go. Just an idea. (I'll be glad to share all of the Canadian > 200K of packet files that I have on the very heated discussions of > spectrum).

No need. I've got the Texas stuff here :-)

Hi. Yes, the Sony is a pain. No-body has yet figured out what the stupid connector is on the thing.
Joel Kandel has come the nearest to finding out by phoning Japan and talking with 'em. The response sounded like they'd never attempted to get data out of it!
There's an ugly rumour that somebody is going to make a cable for it in Japan, but I'll bet it'll be VERY pricey!
If someone has a description of what that connector is PacComm would be happy to build cables at a reasonable price!
Joel sent me a fax showing the connector, but it still wasn't too helpful in helping us track down this thing!!!!!!
Can anybody help???????

Hi Paul!

Do you think PacComm can provide connectors for the Magellan 40 / 45? The factory cable + connector goes for \$30 list, \$28 discount house. It has 4 pins, 2 power and 2 signal.

Miles Abernathy, N5KOB	"I urge you to dream - I did, and one

APR REPLY: You are not the first. I have even seen it occassionally.
We need more info to find the bug (if any)

1. Use a txt editor to see how many labels are in the map file... (must be less than 99)
2. Use MAPFIX to see how many points are in the file (must be less than 2999)
3. Try everything on a different PC. May be MEMORY corruption due to not enough memory. (or free up some more memory on this machine) and see if problem persists...

> and everything works fine.
>

```

APR REPLY: Argh!!!@#\$% Those AEA's! I think we found the problem:

- 1) the AEA monitor display is DIFFERENT than all other TNC's.
- 2) APRS DOES know how to parse it, however, if you indicate that you are using an AEA TNC during APRS set-up
- 3) The fix just described above IS NOT THE CORRECT fix. The fix above removes the digi field, so that the result looks ALMOST like a standard packet header (This tells me that Hermans APRS is NOT in AEA mode) But then it does NOT let APRS parse the digipeater field and build up its D-PAGE.
- 4) BUT it is MORE than that! You can make MOST AEAs look like REAL TNCs by giving it the command BBSMSG ON. APRS thought that this was the final answer, and implemented it in version 6.0 more or less. BUT THEN THERE WERE LOTS OF OLD AEA ROMS OUT THERE that did NOT recognize the BBSMSG ON command. So in version 6.5 more or less, I removed the BBSMSG ON command, and infact, now force it OFF. So now I am back to parsing AEA formats for AEA TNC's.
- 5) I suspect that Herman (above) has an OLD AEA but a version of APRS that is trying to make his AEA look like a TAPR TNC with the BBSMSG ON command. Since his TNC does NOT recognise the command, and continues to output AEA format, he has to make the above mod to get it to work. If so, he needs either a NEWER AEA ROM (anything in the last few years will work) or a newer version (or OLDER version) of APRS.

NOW BACK TO THE PROBLEM AT HAND. AEA TNC's ALSO DO ANOTHER STUPID THING... They default to MDIGI off! That means that they DO NOT MONITOR any packets going through themselves as a digi! In a virgin APRS net, where EVERYONE uses EVERYONE as a digi (RELAY) this means the AEA TNC's do NOT see ANYONE ELSE'S packets that they hear direct!!!!

I BET this is the problem with the guy with the PK-12 (or any other AEA TNC that can't see anyone else unless they go through ANOTHER digipeater... Try turning MDIGI ON.

81. FIXED bug in HSP,GPS,RMC!

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
 Date: Wed, 5 Apr 1995 12:41:41 -0400 (EDT)
 To: aprssig@tapr.org
 Message-ID: <Pine.SUN.3.91.950405123036.17182A-100000@greatlakes.nadn.navy.mil>
 Rendered body type: text/plain

Well, THanks to Karl Metcalf, who phoned that APRS was IGNORING RMC!

That has been the main problem that HSP was not working well for some users. My earlier BETA tests of fixes were concentrating on the timing and selection process for GLL/GGA/RMC, but I never realized that RMC was NOT working at all for OWN STATION! (my GPS doesn't have RMC)

So if APRS saw an RMC and used it, then, since it had a bug and was not then USING the RMC data (for station 0, yourself), that POSIT would not get plotted. RMC WAS working off-the air for other stations....

Anyway, BETA68x.zip is now posted, and I would appreciate someone testing it with a GPS that outputs RMC. Download from the UPLOAD (or APRS) directory of 410 280-2503...

OH yes, this bug will have been in there since 6.5!

WHen this fix is proved good, then I will upload the full 6.8 upgrade...

82. RE: [APRSSIG:629] Re: Sony Pyxis and APRS

From: BARRETTD@CRPL.CEDAR-RAPIDS.LIB.IA.US
Date: Wed, 5 Apr 1995 12:07:38 -0500 (CDT)
To: aprssig@tapr.org
Message-ID: <950405120738.1157@CRPL.CEDAR-RAPIDS.LIB.IA.US>
Rendered body type: text/plain

I believe that the Radio Shack PDA Comm Cable is the same type of connector that the Pyxis uses; so that should solve the cable problem. Then it's just a matter of scoping the wires for data.

Hope that helps!

83. MacAPRS install problems

From: seront@seism1.ess.sunysb.edu (Bernard Seront)
Date: Wed, 05 Apr 1995 12:11:46 -0500
To: aprssig@tapr.org
Message-ID: <9504051710.AA01326@seism1.ess.sunysb.edu>
Rendered body type: text/plain

I downloaded Mac APRS 1.4.2 from ftp.tapr.org.
I had no problem with the program itself nor with the doc but I'm not able to decode the map and data files.
When I unbinhex the files MacAPRS.Map.sit.hqx and MacAPRS.Dat.sit.hqx I got MacAPRS.Map.sit and MacAPRS.Data.sit without (I think) errors; but when I unstuffit (stuffit lite 3.0.3) these files I got two files MacAPRS Map Folder.image and MacAPRS Data Folder.image instead of the folders with the files in it.

Did I missed something or is there something else to do?

To explain everything, here is how I do that:
I need to download the files with my PC, which is on internet, then split the files to put them on a disk (each of them is bigger than 1.4M!), transfer them to the mac (which I cannot connect to internet), join them and finally unbinhex them. I don't think the problem comes from these operations (?) as I can unbinhex the files ok.
By the way, why are these files binhexed? you can ftp 8 bits files, binhex is useful only to send 8 bits files by email. Not binhexed each .sit file fits on 1 disk.

Thanks by advance.

>be happy to build cables at a reasonable price!

I think that the RS232 comm cable Radio Shack sells for their PDA is the equivalent cable it's listed in their catalog. I haven't had the chance to compare RS's PDA and the Pyxis connectors side by side but I have seen both and believe the connectors are the same.

Maybe mfgs should package up a unit for 1.2, or 2.4, or higher. APRS seems
like a good way to start occupying some prime real estate.

Looks good here. I'm seeing RMC/GLL/GGA with NMEA 2.0, and GLL/VTG with NMEA
1.5. Very high success rate. Just about every toggle returns some kind of
valid fix and update.

Wish I could say the same on this end. I d/l'd beta68x tonight and fired it up with the GPS on comm 1 and PK 232 on Comm 2. First thing I noticed was my symbol kept disappearing off the map when I would switch from the regular map to the Y command. I would than go back in and reassign my sysbol and all looked well till I started noticing several other stations on the channel were giving out my posits but I was no where to be found. I pressed the P command and what I saw was the first station at the top of the list was being updated with my NEMA fixes every 10 seconds and as another station moved to the top of the list that station would now be getting my NEMA fixes. This is with the GARMAN GPS 45. I also noticed that the Altitude is still not updating. Once in maybe 20 fixes I might get a Altitude reading. This problem of updating another stations posit seems to have happened in this X beta. I did notice the problem of the sysmbol disappearing when I went to 6.8. I also notice that even though the program says it got a good fix it is not updating the posit each time a new fix comes in. I went 0 C G and the data is coming in prefect. If you want I can send you a grap of about a minutes worth of the GARMAN GPS-45's NEMA so you can see what is being sent out. I can send you some of the NEAM ver 2.0 and the version 1.5. Sorry about the typooooos this is a temp keyboard till I can get my regular one repaired.

>
> Could you fill me in on Tekk radios? Have never heard of them. Are they
> 440 only or can they do 2m? Crystal? How much? Where?

The Tekk Radios (Tekk, KC Mo.) are 2 watt, UHF crystal controlled data radios that look like they were implemented pretty much from a Motorola databook. They are NOT designed for an intense RF environment, like a repeater site, without some work: The front end is NOT up to the drill. They are reliable, inexpensive (~\$110-120, small quantities). They come available with one frequency on ham bands, but for the life of me I cannot recall what it is. If memory serves they'll change freq's for about \$15.00, since THEY have to order crystals.

They can supply you with a teech manual, which is pretty good, all things considered.

Construction is pretty good, with a lot of SMT and some reasonable heatsinking.

I've had little trouble doing 9600 baud right out of the box, but some others recommend a filter change for improved performance. I'd say the radios are right on the hairy edge of 9600 performance.

I guess I need to dig up the phone number, and I'll try to do that over the next couple of days. It's in a pile of paper upstairs, and I have to troubleshoot some hardware first :-)

That is very interesting. We, me and several others, would be interested in putting them in trackers but we want to stay on 145.79 for now. I have been looking for the MFJ data radio but they are advertizing but not delivering. I wonder if anyone has found a source for the MFJ 5 watt data radios?

That's okay Gerry, don't go to the trouble for me since I want to stay with 2m. Anyway, I spent 37 years in KC, Mo so I think I can have someone check it out for me. :)

Thanks a lot for the info!

Kent

Solved!

This may be a little wierd but acting on the advice I got about making sure mdigi was on, and bbsmsgs off, I fired up 6.7b and checked in dumb terminal mode what the settings were. I found that mdigi was already on and bbsmsgs was already OFF. Just for grins, I turned bbsmsgs ON....and the program works like a champ! This particular pk-12 has version 7.0 firmware, sn# 959. Hope that helps and thanks for all who responded!

I just noticed that Radio Shack is selling their 2m HT for \$189 - so, for \$90 more than the MFJ you can get a frequency agile 5W radio with a great rx front end. Tempting...

Hi this is Joel, KI4T. I read Steve's reply to you and just wanted to clarify a couple of things reference the use of APRS at the National Hurricane Center. We will be using APRS to bring weather data INTO the center, rather than using APRS to send weather info out. There are plenty of outlets for that. But we found that weather data from boaters in the Caribbean have been very helpful to the forecasters. Of course we have to convince the boaters to automate their weather reporting through APRS, but that will come. If they know they will have access to other weather reports from the surrounding area, it will definitely be to their advantage to do so.

>From an Emergency Preparedness standpoint, it will be very useful to have APRS in a community. Here in S Florida, we know what happens when all the street signs and landmarks disappear. APRS will be extremely useful in getting teams around an affected area where maps have become scarce or useless.

We are trying to put digis on hospitals. The hospitals are paying for them against the time when they will have to be found by GPS. At the same time it gives the amateur community a great APRS network.

I hope this idea catches on elsewhere around the country.

73,
Joel Kandel, KI4T
jkandel@gate.com

Rendered body type: text/plain

I think it's a big mistake to use other than 145.790 for APRS. It's a simple standard that ought to be accommodated all over the country so that disaster teams coming into an area don't have to second guess where everyone is.

Joel, KI4T

100. Getting GPS to work

From: ke6jgn@garlic.com (Brent Bolen)
Date: Thu, 6 Apr 1995 08:33:45 -0700
To: aprssig@tapr.org
Message-ID: <9504061533.AA26646@garlic.com>
Rendered body type: text/plain

Help,

I have entered my validation numbers, and connected my GPS, but I don't see my position on the display. I enter O-C-G, and see the NMEA strings coming in, so the port and baud rate are right. I looked at the data coming from the GPS and it is: \$GPRMC,151156.75,A,3723.707,N,12202.272,W,00.0,0.0,060495,15.6,E*42 followed by a LF and a CR. To my untrained eye, everything looks OK, anyone have an idea what I am doing wrong?

Brent (ke6jgn@garlic.com)

101. APRS for the BayPac???

From: George.Henry@f668.n115.z1.fidonet.org (George Henry)

Rendered body type: text/plain

Attn Bob Bruniga, WB4APR

Do you have any plans to release a version of APRS which will work with the BayPac packet modem? There are hundreds, or even thousands of us BayPac owners who would love to get on APRS if the software supported us.....

It should be a relatively simple matter to add support of a vector hook to 0x60 for a driver such as AX25DR.COM, which many of us BayPac users use for KA9Q NOS.

At least 4 other hams in the Chicago area that I know of would be happy to beta test for you.....

Since I cannot, due to gateway restrictions, subscribe to this list, please reply directly by fido to node 1:115/668, or by internet to george.henry@f668.n115.z1.fidonet.org.

Thank you!

George Henry, KA3HSW

>

Aaron,

You bet there is APRS activity in the Chicago metro area. On 145.79 we have several WIDE digi's (including one downtown at 650' AGL) an active HF gate and at least 3 dedicated full time WX stations. We are seeing as far west as Iowa (Quad City area) south to the Illinois river and into NW Ind.

There is an active APRS support group formed and we meet on the 4th Sat of

the month, 10 AM, location varies. We support both MAC and DOS versions and have several folks out running with GPS/mobile units. If your interested in more info E-mail me direct at edwardwr@interaccess.com.

Rendered body type: text/plain

The fixes in BETA68x apparently fixed the HSP problems but introduced a DUAL-PORT GPS problem. It caused other stations to USURP your stations position in the P-list! That report came in just in the nick of time!

So BETA68y is now posted on ARN BBS 410 280-2503

Do not bother getting it UNLESS YOU are running GPS!

If you are running GPS, please do, and feedback any probs ASAP. TNX...

It may still be in the upload directory if it has not yet gotten to the APRS directory...

I really hate to sound pendantic, but while it might be a good idea to have one coordinated nationwide frequency FOR THIS ONE LITTLE APPLICATION, it was not ever, ever pre-coordinated with any of the real frequency coordinating bodies. They have to deal with repeaters here, there and everywhere, packet operations that don't conform to the packet-allocated frequencies, demands for more repeater space from frustrated trustee-wannabes, complaints of interference from frustrated trustees, and interfacing with the next coordinating body or bodies that adjoin their service area who might just have to work within a different bandplan!

Before publicizing 145.79 for APRS, some legwork beyond the ARRL's poorly considered attempt at a bandplan should have been consulted.

Bob,

I'd like to second that request. Here in Europe, BayPac or Baycom modems
have probably even more followers than in the US. Particularly for my
students, it is simply the cheapest way to get on Packet.

I know this is no simple task, but maybe there is someone out there with
Baycom interfacing experience who could help out.

Thanks in advance,

73 from Ulm,

Hermann

Chuck,
I have been running it with warp for sometime now. I only use VGA
(since I have a com port conflict between com4 and the ATI SVGA card).
I usually run it in a dos full screen mode and leave it displayed
when I'm not doing anything else. Make sure you are not sharing
interrupts with the com ports (ie, if you are using 4 com ports, that
they all have unique irq's).
Cheers...mike

I've run it succesfully on OS/2 V3 (Warp) for Windoze, and on the full
implementationpackage. The full implementation package works better than Warp
for Windoze, because, I suspect, Windoze has its own set of overhead and
problems.

I have not refined it to run in a seamless window in OS/2 just yet, but invoking a full-screen DOS session and doing it works fine. For the record, I've spent a lot of time trying to optimize parameters, and suspect I've over-configured it a little.

I use the STB-4-port card, which gives you a pretty good selection of addresses and IRQs for each port. I've 4 ports available and no port or IRQ conflicts with anything.

Since OS/2 does not share IRqs gracefully, this is outstanding advice.

I've tried it and it worked fine in a DOS box, full screen. APRS is not "multitasker friendly" or "OS/2 aware" though. Expect to see the PULSE meter at the top all the time. It hogs a lot of ticks.

Rendered body type: text/plain

Help... My good friend K2ADJ's son, Rob, loaned me a Genius (manuf) NewSketch 1212 graphics tablet. I have/had (!) high hopes of digitizing the entire ARRL section of SNJ (not really) and was quite excited when I was able to borrow the tablet.

I ran the test programs to confirm the tablet was working ok. It will work from COM1: or 2 and will emulate a 1.Summagraphics MM Series, 2. Bit Pad One/CalComp 2000, 3. GTCO Digi-Pad (Type 5), 4. GTCO Digi-Pad (Type 7), 5. Hitachi Tiger.

I compiled the MAPFIXER program and it boots up ok and I'm using it correctly... I think... I read the docs and as far as I can tell, I'm following the procedure but the MAPFIXER doesn't seem to talk to the tablet and/or vice-versa. The MAPFIXER does crash out with an error message but I forgot exactly what it was... I will do it all again if anyone wants that error code. Hitting any key, of course, brings me back out to DOS.

Thye docs do mention modifications of the .BAS source code depending on some tablet make and models. Might that be necessary here? Is one of those types above gonna work at all? Help! Whatever anyone recommends, I'll do. I've got tons of the USGS 1:24000 7-minutes maps that I'm just itching to make into APRS maps for South Jersey. Thanks to ya'll for reading & helping.

Frequency coordination on 2 meters is so confused and testosterone-laden that's it essentially impossible to get anyone to agree what to do. The best advice I've ever heard was ignore all the complaints and do what you want, i.e., put your APRS stations on 5.79. Sounds vicious, but it's effective.

We had a nice 2-meter tcp/ip network going on 144.91 in SW Connecticut for a few years, when along came some DX Packet Cluster guys who decided to set up a Cluster there because we were 'under-utilizing' the frequency. We yelled and screamed for months; they refused to move, do finally we moved... to 5.65 where we got yelled at by folks who used that frequency for long-range fm simplex QSO's. We would not move again. _They_ finally gave up and moved... I don't know where; maybe they got some SSB rigs which they should've done years ago.

Two-meter simplex is a dog-eat-dog place. We should have some nice packet repeaters, but no coordinating group around here will assign a freq. pair for a non-voice application.

Bob Bruninga,

Just a little update on running APRS in background.
I'm using 62b and have the Windows video driver set to VGA.
It seem to work (in the background) with a limited number of programs.
It works with MS Works, Dynodex, and AOL software.
It doesn't like XTGOLD, or many other DOS based programs.
Seems to like "Windows" based programs better.

Hope this will help you some.

Chuck Alldrin Chico, CA

Concerning GPS frequencies, I hope that everyone has tried the APRFREQ.BK file which displays a USA map with all the known (reported) APRS frequencies. (It used to be called USAFREQS.bk) I welcome any additions to this map. So far, I havent gotten any new reports in months... I only want freqs where there are PERMANENT WIDE's OR at least COORDINATED activity. This map makes an excellent pre-travel guide....

If you have an input to this map, send it by EMAIL. Just send me in text format the LAT/LONG and FREQ. These labels are meant to show at the USA level, so if you have multiple WIDES, we only want ONE report.

Just posted 6.8. THings you will notice (maybe)
* fixed HSP probs due to APRS not storing RMC from its own GPS
* New OPS-DIGI commands
* alt-SETUP-GPS-GGA command for selecting GGA only (gets altitude)
* KAMS no longer get "GATE BITCH" when on VHF side
* MESSAGES now have their own screen! (swapped R and T commands)
* Fixed 43 line 3D altitude display
* RESTORE.TNC is now in APRS\SYSTEM directory. Move yours there.

that'
mpossible to get anyone to agree what to do. The
best advice I've ever heard was ignore all the complaints and do what you
want, i.e., put your APRS stations on 5.79.

Sound's nasty alright but seems to be the way of the world! I'd say stick to 579since that seem's to be the majority of APRS usage and let's be realistic
APRS is a much better usage than a bunch of wennies saying nothing on a repeater. I'm sure I get some flames on this but so be it. APRS decays the station location over time, has direct Public Saftey benifits and is useful for tracking ballon launches, DFing, Weather reporting, parades, and other events. If allocation was based on Public Service cabapilities it would be no argument.

Feel free to jump in but keep the Flames to a low simmer I can be a sensitive type and can't afford a shrink to mend my feelings :>

 Title : APRS ON PALMTOP?

HI THERE.

NAME HERE IS MIKE AND I LIVE IN FOSTER CITY, CALIFORNIA. I WOULD BE INTERESTED IN HEARING FROM ANYONE WHO HAS SUCCESSFULLY USED THE APRS PROGRAM ON A PALMTOP COMPUTER. PRESENTLY I HAVE A HEWLETT PACKARD HP95LX AND A KANTRONICS KPC-3 VERSION 6.0 AND A RADIO SHACK HTX-202. I HAVE BEEN ABLE TO USE THIS SETUP FOR REGULAR PACKET OPERATIONS, BUT I WOULD BE INTERESTED IF THE APRS PROGRAM WOULD BE CAPABLE OF RUNNING ON THE PALMTOP, MAINLY DUE TO THE SMALL SIZE OF THE SCREEN (40 X 16) AS OPPOSED TO STANDARD 80 X 25. ANY HELP WOULD BE GREATLY APPRECIATED.
 THANKS!

--- End of message #79675 to APRS from AC6JA ---

APR COMMENT. Get it working first in QBasic...

And before that, get it working with PROCOMM!!! Configure the table to output data to PROCOMM in the following format whenever you CLICK the mouse or when you press the button or whatever:

xxxxx,yyyyy,z

The x and y values are decimal such as 1234,5789 and the z can be just about anything or even be missing (I think) If the z matches whatever I have in MAPFIX, then you can use both the button 0 and button 3, but if it doesn't match, at least you will get the point. Make that at 9600,n,8,1 and it should work!

I use MicroSoft's QuickBasic Compiler 4.0 where 4.5 is the latest I think. It doesn't come with DOS... it's a separate standalone BASIC compiler but not their superduper professional program.

I think the push is on toward Visual Basic which is a "compiler" for WINDOWS stuff. This is all I know!

In SoCA, I am told the APRS frequency is 144.990 as assigned by TASMA.

I haven't got my APRS station on the air yet, but the local gurus encourage us all to use this frequency for APRS packet activity.

144.990 in SoCal was assigned as the experimental modes freq, however, tcp/ip at 9600 bps is what you'll find there. I have never heard any APRS stations there. Most of us are probably on 1200 baud in 146.745 -600.

Of course, that doesn't mean you couldn't set up there...

144.990 is a 9600 baud ONLY freq in SoCal. You will not find any 1200 baud APRS here. Most of the APRS activity is on 146.745 duplex packet repeater.

APR WANTS: APRS FREQ's

Bob, please remove from you APRSFREQ.BK the digi site of W2HOB on 147.345...

Eastern PA, all of NJ, SE NY State and the southern Teir of CT (as far as I know) is all on 5.79 with multiple WIDE's in each state...

Maybe a large BOX would be fitting, hi. expand the box as the network expands here in the NE...

The digi on 147.345 is still there but 99 44/100ths% of the APRS activity is on 145.79 all the way to Cape May.

Gotta ad my 2 cents worth to the "taking of a frequency for APRS".....

Here in the Delaware Valley we came up on 145.79 early in the game only to learn 2 nights later that there was some ATV on the frequency, a net held every night for one hour by a group of about 6 members.. So, we decided to give the hour to them, well, it didn't last very long until they decided to MOVE to another "quiet" frequency...

It is not the real way to do it but if you ask your coordinator for 145.79 I guarantee you he will say it is in use so you are still out in the cold with the rest of the gang.. Here in the North East there are no quiet frequencies so if you want to operate on 145.79, just go ahead and work with the BBS's, NODES, TCP/IP, ATV and DX Clusters and finally they will get sick of all those extra APRS Packets and they will move - eventually!

73 all and by golly, have fun.....de Rod

For those who can not find this version via Internet, I did down load to my LLBBS from ARN BBS this evening. There are 3 versions availble: APRS68.ZIP - The full version - 65to68.zip - The upgrade and 67to68.zip for those who are always on the cutting edge.

These files are available on the first logon - once you get past the logon...:-)... At the main menu type "T" (Transfer Section) then Type "2" to get to the APRS PROGRAM section, then "L" (list) followed by a return to see the file list.

If you long on for the first time, please write down your user number, the phone number you entered, and your password. You'll need all 3 to log on again.

The April issue of GPS World announce that applications are now being accepted for the 1995 GPS Application competition. The following is part of their announcement (please note - the typos will be mine, not theirs)

"Send us your most interesting application of GPS. Did it solve a problem? Did it save time? Save Money? Help save the environment? Or just allow you to do something in a unique way? We want to hear about it and publish it in the magazine."

"To enter the competition, send us a brief typewritten description of your work (no more than 300 words) along with slides or color photographs that will better explain what yuo've done and document the project. An independent panel of judges will evaluate the submissions based on three criteria: uniqueness, technology, and praticial results. The best entries will be published in the August 1995 Showcase issue of GPS World."

"To enter the contest, send your entries before June 1, 1995 to:
Molly Trudeau, c/o GPS World, 859 Willamette St. Eugene OR 97401-6806
.... . You may also e-mail your text to mggpsworld@aol.com."

Gee folks - ya think APRS and it's multiple applications might qualify ?

Bob, Ya got the P problem resolved OK, however the position info is still not updating correctly using the GARMIN GPS-45. I went Alt-S-G-InfoGGA and I still see occasional RMC fixes in the P list and the Altitude only updates maybe once out of 10 updates. Most of the time on the P line for my Station the end of the line shows GLL/NUL/LAST NEMA FIX. One thing I was not clear on...is there a GGA command suppose to be in the GPS command line. I only found InfoGGA. I found no GGA command as stated in your message. One other problem... my Object i.e QTH-YAGI shows up when I set it from My-POS but if I change to the 3d map and back the Symbol disappears and all I have where my position is is a tiny dot with a tiny circle around it or just a dot. I have to go back into MY-POS and reset it again. This just started showing up in 6.8. I went C-O-G and looked at the data from the GPS and it looks fine. Is there a possibility that the other letters at the head of each line just before say the GGA is causing a line length problem when you parse the data in. I am not sure if you use fixed record lengths for the incoming data from the serial port. I can't remember for sure but I think there is a ?M before each string coming in from the Garman. I also found if I switch the GARMAN to NEMA ver.1.5 I always get RMC fixes. Hope this helps.....

143. APRSFREQ.BK Clarification

From: W2HOB@aol.com
Date: Fri, 7 Apr 1995 16:20:20 -0400
To: aprssig@tapr.org
Message-ID: <950407162017_75376318@aol.com>
Rendered body type: text/plain

Just a quick note to clarify something about the WIDE digi network in SNJ...

I just took a peak at the APRSFREQ.BK map and if everyone adds to this it should provide mobilers a nifty reference while travelling.

In Southern New Jersey... there shows the frequency of 147.345. This is a node W2HOB-3 which has digi turned on and posit info in its btext, but it is not the APRSNET frequency for SNJ. We used it in the infancy period of APRS to experiment with. It is the section-wide node site for ARES and NTS operations and while we still "experiment" there from time-to-time, South Jersey has "standardized" its APRSNet on 145.79 with WIDEs, UL-IIs, GATEs, etc etc.

Bob, WB4APR, would you be so kind as to change your distro file to show SNJ on 145.79. We have also been monitoring 445.925 and haven't heard a peep from anything else... maybe this UHF will catch on!

Still havin' fun... 73 de Boyd AR

Please do not use 144.990 as an APRS Frequency unless you are running
at 9600 Baud....This single frequency was designated for use as experimental
9600 and above....because it was felt that 1200 and 9600 do not mix on the
same frequency....146.745 as well as most of the other authorized digital
frequencies are available to APRS users and you should not cause a problem.
However, using 144.990 will make APRS users an unfriendly neighbor....

There is a move afoot to bring 145.790 into the packet community for
APRS....Please help by assisting the SCDCC in this effort.

Hi John,

I will reply to you on SIG so everyone can share info. Here in ST.Louis
MIRSA (Mo. Ill. Regional Skywarn Association) and The St. Charles ARC run
a packet wxwire system from the local NWS office. The program that we use
called PC-AFSO could be used to input NWS products to any packet system.
What we do here in St.Louis is we tap a printer in the NWS office where
a copy of everything is sent for records. Just need two wires signal and
grd, run the data through the PC-AFSO where this program picks out the
products that we want to send out and transfers the data over to a
computer running MSYS BBS. We have the foward time set to -1 and so
anything that is enter as a bulletin is automaticly forwarded to other
BBSs via 9600 backbone system. One could input that data to APRS and

have it sent out I suppose. I have not done anything yet with the APRS due to lack of equipment and tower space at the NWS (they are buying us a new 80ft tower which will free up some antenna space right now we have a 25 footer.) It should be noted that after we got up and running we found on a average storm system that as many as 300 bulletins canbe generated, that blew some BBS OPs minds. If you would like to get this AFS0 program have your guys at your local NWS office get a hold of Bill Gerry from the NWS Regional office in Kansas City, Mo. His Inet address is:

William_Gery_at_W-CR-HUB@smtpgate.ssmc.noaa.gov

Now for the Doppler images, A fellow in Tulsa OK named Hinson wrote a program that allows RCM products to be sent over and view via packet. The RCM product is a graphic file of what is on the radar screen. In STL this product is captured every 30 mins and stored for records. We are going to move this time up to every 10 to 15 minutes. The product is binary and Hinson's program converts it to ASCII and is transmitted via packet on the users in we down load the file put it in his viewing program and we have doppler radar image in 6 or 8 colors. On can store several of these and the program will loop them giving you a moving picture.

Thats about the story onthat Bill is working on interfacing the radar stuff into the office network so that installation canbe done at any NWS office.

Need more info letme know.

```

Although I'm not an accomplished APRS user, I do run it on my 100 LX on occasion. Here's what I have set up:

- A standard off-the-shelf HP 100 LX, with just the 1 megabyte of memory that comes with it; no PCMCIA card or anything like that.
- A PacComm Handi Packet TNC (Very small, internal Ni-Cads or external 12vdc. A great unit!).
- An earlier version of APRS - 4.?, I think.
- A Yeasu 2 meter radio. I find that using an H/T just doesn't have the punch needed for APRS or regular packet use.
- A small 1/4 wave magnetic mount antenna for almost anywhere operation.
- A cigarette lighter / alligator clip arrangement for powering the radio from a car, boat, whatever.

In order to run APRS, I have copied APRS???.EXE, USA.MAP, and my local map (MABOSTON.MAP), and MAPLIST.APR into the director structure required by the program.

I start up the HP, and in the Applications menu (the screen with all the icons) choose Menu, Applications, Terminate all. This closes out all the stuff running in the background, and frees up memory for APRS. You may have to fiddle with the memory configuration in the System screen to make room for the APRS files, but it shouldn't be too difficult.

It is slow, compared to running on a 486 machine, but once you are in the map you use most, the performance is acceptable. The screen aspect is off a little, because the HP display is wider than it is tall compared to a regular pc display, but if one has good eyes, the detail on the lcd display is clear and readable. I'm not sure what the difference between the 95 and 100 is, so you may not get the same results.

As I said, I'm by no means well versed in using APRS, and haven't yet mastered optimizing my digi path for the most efficient use, but have gotten it to receive and transmit with APRS, and the screen updates seem to confirm normal operation.

I have a Garmin hand held GPS I use on the boat, but haven't had the time (read I don't have the talent) to link them up to report my position.

As an added bonus, the built in comm software in the HP works just fine for regular packet operations, and doesn't take up any useable memory!

Good luck with the project, and let me know how you make out.

Jim,

I don't have my packet station on the air, but in telephone conversation with Del Radant, N6JZE, (619) 279-7692, one of the ARRL 00s in San Diego, he assures me that the only correct place for 1200 bps APRS stations on 2m is 144.990 in San Diego. I'm told this is the coordinated place for this mode, until something else is assigned.

He tells me that there are 32 stations on the air on this frequency in San Diego now. (Plus three unknown mobile stations Beacon IDing with JLI, MPK, PGY, and MZB.)

At a local presentation at the San Diego 220 club in March, the frequency 144.990 was announced as the officially (TASMA I think, but am not sure) coordinated frequency for APRS on 2m.

If this is not correct, we in San Diego await further instructions. It makes no sense for me to operate my station differently than every other station using APRS on 2m.

Well, my thanks to all who supplied info for the Genius NewSketch Digitizer. It works... very tedious, but I am on the road to success... not there yet, but on the way!

Special thanks to Bill, KE4EER (wnolle@fly.hiwaay.net) for a little program to slow down the puck's output... Bill, I still gotta be quick and not hit the button too long or a string of the same positions comes streaming out! I may try to stretch out the FOR NEXT statement if that 's ok by you. I compiled it and it's gotta be run.

Bob, APR, would you be interested in this little 6-7 line gem? I can send you the BAS source. You did ask and FYI, the tablet outputs a lot of points at once... I line up the puck's crosshairs hold it with my left hand and just tap the button for a point to take... gotta be quick!

The tablet does have the coordinates as you said and MAPFIX68 corrects them and keep on truckin'! Now... why does my back hurt... when I got up to go to the bathroom, I was walking up the stairs all hunched over... does this go with the job?!!!! Hi Hi

Have fun now... de Boyd AR Thanks again everyone.

I must say that I am amazed and somewhat dismayed by the comments of those who have said they have, or have experienced others, securing a frequency by interfering with other's use of the frequency. This seems in direct conflict with the letter and spirit of the law and credence of Amateur Radio. There seems there must be a better way.

I understand what the gentleman in CT said. As a resident of CT I am fully aware there is NO coordinating body, which is rapidly causing a mess of repeaters and other frequency allocation/distribution in our fine state.

This does not, however, mean that one should resort to brute force or stubborn determination to win a frequency.

I think I might seriously consider what legal actions could be taken if a particular activity was established on a frequency and another activity just ignored our presence and started using it in an attempt to drive the first activity off.

I know this doesn't directly relate to APRS specifically, but since we were discussing a 'nationwide' frequency and how to secure one, we ought to ensure those who might have some footwork to find a frequency will be utilizing appropriate measures to secure the frequency.

I can see that my plea and request not to use 144.990 could have been inappropriate. Especially if someone thought I meant the whole of SoCA. I should have limited my comments to those stations in and around the Los Angeles area. How close that is and what effect you will have on 9600 Baud and above users depends on your location. The most widely distributed and available source is that Repeater Location Guide which on page 24 shows Packet Radio Band Plans. The frequencies it lists are the generally accepted digital frequencies for 2 meters, however, we are all aware that 144.950 is used by SAREX and should not be a General use or BBS frequency.

> the generally accepted digital frequencies for 2 meters, however, we are
> all aware that 144.950 is used by SAREX and should not be a General use
> or BBS frequency.

Jim, just a quick note: While SAREX utilized 144.91, 144.93, 144.95, 144.97 and 144.99 for random voice contact uplinks, we don't claim those as "ours." We do ask tolerance, however, from the other users. SAREX, although flying more frequently than we used to, is still a periodic event. We "staked" out a number of frequencies well before packet radio existed. We are continuing to use them. We don't want to cause interference but it's considerably easier for others to either move or go quiet when we're overhead, and really that's all we ask... Let us operate, and work with us.

If that translates into a "no General use or BBS" statement, OK... We'd prefer to be good neighbors on this.

73,
Gerry

With reference to Emmet2's comments about securing a nation wide frequency for APRS or any other new mode, who is going to say or coordinate it.. The logical one that comes to mind is the ARRL but they won't touch frequency since it is a hornets nest to start with and no one will agree with them.

(...)
> P.S. Remember the "target" frequency of 445.925 on UHF too.. See UHFfreq.txt
> (although I still have no reports of anyone there yet..)

In the Northern Calif area, 145.79 is heavily used.
(This is from an old CPRL list and may be somewhat dated)

FMTMB	N6QMY-1	145.79	BBS USER PORT	FREMONT	B
FMTNOD	N6QMY-2	145.79	SOUTH SF BAY AREA	FREMONT	Q
KERN	WB6ODZ	145.79	BBS/USER PORT	WOFFORD HEIGHTS	2500 B
KERN1	WB6ODZ-1	145.79	USER NODE	SHIRLEY PEAK	7125 N
LAY	K7WWA-10	145.79	NO. MENDOCINO CO.	LAYTONVILLE	4480 N
#BLBBS	N6MPW-7	145.79		BEN LOMOND	BQ
#BLNOD	N6MPW-6	145.79		BEN LOMOND	N
?	N6REB-2	145.79		MODESTO	B
?	WA6KTK-2	145.79		MANTECA	B

445.925 is the *INPUT* of our radio club repeater (K6BJ) in Santa Cruz.

The defacto APRS frequency for San Francisco and Monterey Bay is
145.010 via K6TAM-5, W6CX-3 and WA6AFT-3 full time digipeaters.
These are all on mountaintops. My current beacon listing for
Sunday afternoon (APRS busy time) shows 24 different call signs
in the last hour. The beacon list also shows just about every
APRS version distributed. During the weekday commutes, there are
2-5 mobiles with GPS appearing.

One problem with "experimental" frequencies is that once the technology
is proven, it's hard to get people to move. 146.52 is alleged to be
the "calling frequency" but has degenerated into the local rag chew
channel. The 441.875+ "test pair" is occupied by dozens of private
phone patches. HF packet forwarding was suppose to be "experimental"
but became permanent. If anyone knows of an unoccupied nationwide
frequency suitable for APRS, please let us know.

```

Bob...

Sure do appreciate your help with solving the MFJ 1278 communication protocol dilemma. I went over to WB4ZVH's QTH and had him up and going in no time. Here are the changes I made from his defaults:

```

PAR 0
8BITCONV ON
AWLEN 8

```

That did the trick.

Thanks again.

73,
Bill

I tried to buy one a month ago, and it seems that it is not available (the computer store here at the university didn't found it in microsoft catalogue). It has been replaced by Microsoft Basic 7(for dos), and by

```

visual basic (for windows development).
Perhaps you should be able to find qb45 somewhere, but microsoft basic 7 is supposed to compile everything from qb45, and is supposed to be better. I never tried it.

I echo the sentiments recently expressed about the inappropriateness of just grabbing a frequency. And to be sure that no one attributes that kind of un-gentlemanly behavior to me, let me again state my objective in targeting 145.79:

Since mobiles with GPS cross political boundaries, there is an advantage to finding a nationwide GPS tracking frequency. As a target, 145.79 has been proposed. If you can get this frequency coordinated in your area, please do so. I am NOT advocating just taking it over if it is already in use..

> I WOULD BE
>INTERESTED IN HEARING FROM ANYONE WHO HAS SUCCESSFULLY USED THE APRS PROGRAM
>ON A PALMTOP COMPUTER.

Not directly related to that, but when I tried mac aprs this weekend on my mac lc, 6 meg of ram, i couldn't run anything else.
It would be great if we had just a minimal program (for mac or for pc), using as less memory as possible, just grabbing pertinent data from the com port (stations position, messages ...), saving them in a file that is readable by aprs, and sending a few packets when needed (basically only ack packets, the station position can be send by the tnc with the beacon function). So one could leave this program running in the background all the time (using the computer for something else), or run it on a small palmtop; and just read all these data when starting aprs to be in the network with all the information on hand.

The Macintosh version of APRS will run in as little as 4meg with everything installed. It will run in even less if you disable the data bases. See the manual on how to do that. (You simply remove the data base files from the DATA folder, and they won't get loaded) Many people have run MacAPRS on 4meg Mac Pluses and it runs fine.. with the program only using 2meg.. It has also been run on the old Macintosh Portable with 4meg and a Powerbook 100 with only 4 meg..

APR REPLY: Remember that APRS changes your time from local to ZULU as you switch between HF and VHF. This screws up times for position reports considerably!! All the ones on your P list already, will remain with the time AS RECEIVED. But after you switch, all new posits will be in the new time. I donno of a solution, cuz , time s on HF should be in ZULU...

Coordinated by who I might ask, certainly not Tasma. This was an unfortunate choice as it is the ONLY vhf 9600 baud freq in SoCal. If you were unaware, these modes are incompatible as 9600 modems have state dcd and will happily key down on 1200 baud. We have an internet gateway and bbs right on the coast in orange county which will be in conflict when the summer duct comes in. In fact both the OC and LA county internet gateways are on 144.990. Will SD mobiles ever come north?

Folks this points out the need to choose carefully your local APRS frequency and work with the local coordinating body. I would hate for APRS to get the reputation that dx-cluster has earned by doing their own thing without regard for their neighbors.

Yes, Tasma the Two-meter Amateur Spectrum Management Association. The coordinating body for Southern California. Contact them Bob, join for \$10 and you can vote. I don't know why it happened, maybe they couldn't find another frequency. Close work with a coordinating body is what happened here. Maybe that is not enough.

Attn: Bob Bruninga, WB4APR

Would you consider including the FidoNet node numbers of the BBS's that distribute new releases of APRS in the doc's somewhere? Also, you might want to make arrangements to release into the Ham Distribution Net also, for better coverage. The ftp server is ftp.iea.com, directory /pub/borg/hdn, FidoNet 1:124/7010, CrossNet 73:6101/1

Thanks!

If I'm not mistaken, doppler wx radar data are proprietary. I think WSI
(?) controls the dissemination.

Someone correct me if I'm wrong.

There is ASCII radar data from the NWS, the SD data sets, available from noncommercial Weatheration systems or commercial online services (Compuserve, GENIE, etc.) The SD data sets are very similar to the SA "Surface Airway" forecasts that are obtained from the same sources. APRS already has the capability to parse and display data from the SA data.

The SD data is designed to be read (with some difficulty) by humans, and I have a program that parses it and delivers some pretty good color radar summaries. When compared to "actual" radar the results are very close.

The SD data doesn't take too many characters to convey the current radar information. The DOS program I have, Weatherview (shareware), does a fine job of displaying the results, although the "pixels" are little boxes that appear to be rather large, maybe a mile or more square.

Sometimes I notice crude ASCII character graphics with the SD command, but most of the time it delivers 2 or 3 lines of SD formatted radar summary information.

For an example, I have included the section of my Weatherview doc that describes the SD data format, and a session from my local Weatheration service with some sample SD data from 1900 EST 4/10/95.

Jack

Excerpt from WEATHERVIEW documentation with explanation of SD data format:

The data retrieved in the raw SD format is decoded in the following manner.

Format:
Station ID/time/location intensity azimuth and range/movement/
tops/precipitation type-intensity trend/remarks/end

Example: NYC 1930 AREA 2 TRW++/+ 297/130 152/115 160W C2620
MT 300 AT 254/39 HAIL REPORTED THIS CELL

NYC RADAR 1930 UCT; AREA OF ECHOES 2/10 COVERAGE, VERY HVY
THUNDERSTORMS FROM 297 DEGREES/130 NM TO 152 DEGREES/115 NM; AREA IS
160NM WIDE;MAX TOP 30,000' AT 245 DEG/39NM; RMKS PLAIN LANGUAGE;

Intensity Decoder

Level	Echo Intensity	Precip Intsy	Rainfall Rate
-----	-----	-----	-----
1	Weak	None or light	<.1-.2

2	Moderate	Moderate	.1-1.1
3	Strong	Heavy	.5-2.2
4	Very Strong	Very Heavy	2.2-4.5*
5	Intense	Intense	4.5-7.1*
6	Extreme	Extreme	>7.1 in/hr

*= only in convective situations

8	Unknown but associated with severe wx
9	Unknown

Abbreviations

HOOK - signature "tail" usually associated with tornadoes
 HAIL - radar indicated hail
 LINE - echoes are in a line
 LEWP - Line Echo Wave Pattern - wavy line
 FNLN - FiNe LiNe; narrow non-precipitation echo pattern
 BWER - Bounded Weak Echo Region - echo free vault within a cell
 ALFT - precipitation ALoFT
 MALF - Mostly ALoFT precipitation
 PALF - Partly ALoFT precipitation
 MLVL - Melting LeVeL; radar detection of melting of frozen precip
 PCLL - Persistent CeLLs
 SLD - SoLiD areas of 80% or more

PPINE - equipment normal; No Echoes
 OM - inOp or out of service for Maintenance
 NA - observation Not Available
 NS - equipment normal; No Significant echoes
 ROBEPS Radar Operating BELow Performance Standards
 ARNO - Azimuth Range indicator iNOperative
 RHINO - Radar Height Indicator iNOperative

Note: above SA and SD decoding information was taken from the
 Compuserve file WXDECO.TXT.

The NWS radar stations take the SD digital radar reading at
 approximately 25 minutes past the hour. It is usually available for
 download at 40 to 45 minutes after the hour.

>
```

The above SD is also called a ROB (Radar OBservation). The line beginning with ^IL1 is the MDR or manually digitized radar portion of the ROB. It is from the MDR that many plotting programs get their data. The letters correspond to grid boxes with MM being the grid box at the radar. The boxes are pretty big, I think they are about 10 miles square and are biased to the highest reflectivity found in the box, so that you only get a very rough idea of precip areas but not individual cells. For APRS use on a local level the MDR data may not contain enough detail for most users and certainly not enough for Skywarn/ARES/RACES/EC uses.

The RCM message is quite different from the ROB in that by using the correct decode program, the RCM gives a contoured plot of each of six reflectivity levels, plus the storm tops, plus movement, plus winds aloft. The RCM message is usually not that big (around 5k) when there are a few storms.

Now the question, what is the format of RCM data so that it can be included into APRS? Sorry, I'm working on that one and will have to get back to everyone interested.

It sounds like the Weatheration program I'm using is parsing the MDR data. I looked at today's data on the graphic display and the little boxes appear to be about 10 miles or so on a side, maybe a bit less.

The advantage I see with this (the MDR format) is that for just a few lines of ASCII, one can get some pretty decent graphics. I agree that the level of detail may not be sufficient for local operations, and that, combined with the latency, may make it ineffective for emergency use, i.e. Skywarn. But, it's hard to beat the graphic output that can be obtained with the small amount of data in the format.

Where can the RCM data be obtained, and what software is needed to display it? I'd love to have a program that can display the radar conditions with more detail. The Weatheration banner talks about optional (\$) services that include a better radar displays - but the user needs their terminal program to display it.

Gee. We were just talking about this on the linked repeater system down this way...

I've got to talk to a couple of folks re: data formats and processing. I was thinking in terms of doing a raster-save of the static (it really is in vel. mode) image, doing a vectorization of the data, and an MPEG-type proc to see what's changed. Then, the data would be sent as RADAR station lat and lon, azimuth, distance, dBz, velocity. This would be a pretty reasonable packet, although the total data would be of variable length. Some of the preprocessing power, before it got into the packet system would have to determine gating thresholds for the dBz and vel. data, too, or we'd be updating a lot of data pretty frequently.

I suspect a subset, plus/minus appropriate processing, might be doable, if WSI and NWS are approached properly. Especially if NWS puts pressure on WSI. The data format for the WSR-88D is a government document, so, finding the appropriate ICD (interface control document), while tedious, should be possible.

Yes, there are some other programs out there like WeatherGraphix that do the same thing. Many national radar summaries use this data on a national basis but now mosaic images of Nexrad sites give a higher resolution image.

Yes, but the RCM files are not woppers and could be transmitted
 via packet within a few minutes. What we (the Colorado Springs,
 El Paso County Skywarn folks) would like to do some day is take
 the RCM data (which in most places is only available on an hourly
 or half hourly basis) and plot it on the APRS with a close
 in map, say 50 mile range. Then we would take a few of our
 mobile spotters/chasers, put a GPS/radio for beaconing location and a
 voice radio for comms in their car and send them out. Imagine how effective
 a net controller/NWS office could be with storm and spotter data
 on the same screen!

I'm not sure where one gets the data yet. Maybe ask the local NWS
 office? I think it will become available in the same way one
 receives the SD data. As far as the program, I'm doing some
 looking around for it but have nothing yet. If I get something
 I'll let you know.

I'm used to calling the RAREP portion Craig calls an MDR the output of the PPI (Plan position indicator). You can talk the responsible NWS office out of a copy of the grid box overlay they use to generate PPI data. As Craig indicates, they boxes are quite large. So large as to perhaps be of questionable utility...

Exactly. Also the newly commissioned doppler facilities generate output with much greater resolution than the standard 6 VIP levels we're used to seeing on the crummy old 50's era systems. But neither this enhanced data nor the finer resolution available from the commercial outlets are to be found in freebie SD reports.

Here, here! I agree. That was my comment from the beginning. That would also be of use for a mobile unit being tracked, where you just wanted enough to process GPS and transmit/log.

I do believe, correct me if I'm wrong Keith, that you can significantly lower the RAM allocated to MacAPRS, however, you will also diminish its ability to open multiple windows (which may be not be such a setback for the cases we mentioned). Can we get a special 'stripped down' version, Keith, that is streamlined for those type operations (limit it to one window, no special data types, etc).

Info, re MFJ-8621 Data Radio. Ordered on 12/12/94, advise of about an 8 week delay in shipping, now 17weeks and still in non receipt. Called week ago, advised 4 Ham's Beta testing, but no reports rcvd as yet. 50 in warehouse ready to be shipped if beta test ok. No required (Fed Law) 30 day notice of non-dlvry rcvd fm MFJ, normally orders also cancelled after 60 days of non receipt. (Fed Law). Advised all orders still on file, and will be delivered when units tested ready to ship. 2 years ago, waited 11 weeks for a delivery from MFJ. Is'nt it time we Hams write and raise a little cane with MFJ, this is kinda ridiculous. They advertise long before, tested and ready to ship they must send to China new orders and returned by slow boat from same. Mighty Fine Junk, and we are suckers to put up with them.. 73's & Enjoy, Bill WB6LPG@KA6EYH.#NOCAL.CA.USA.NOAM

I think ham are now seeing how MFJ works...

I manage a very large ham radio store in Canada, and we have to fight tooth and nail to get stock. It is not uncommon to wait 6 months for a specific product. It makes if very frustrating to keep our customers satisfied. This is just not a one time thing. It happens all the time.

The scarry part is that MFJ have now acquired Mirage Amplifiers.

Rendered body type: text/plain

Well, I finally figured out why some folks are seeing the /raw* without the rest of the lat/long posit. And of course it is teh result of the efforts I have been making on cleaning up the HSP mode. In 6.8 i grab the first GGA, GLL, RMC that comes along, and lock out any more until the HSP is complete. The problem is that I didnt lock out enough! The GLL that is "locked out" after a GGA has already been received is still generating a POSIT, but without a lat/long! Trivial to fix.. Will be in version 6.8a by Monday evening.... sorry...

I recommend that everyone halt further distro of 6.8 in areas where there are GPS stand-alone-trackers on the air.

Yes, but its the only game in town? Can anyone find a \$119 5 watt 2m radio anywhere else? I would buy it anywhere I could find it! hi hi
They have been upfront on the phone and said there is a technical problem and they are trying to fix it. I'd rather finally get a good radio than one with bugs (don't laugh you guys! software is different... hi hi)

And the pre-advertising is frustrating, but at least we know its coming... Id rather know a cheapie is about to be released before I spend another \$350 for a 2m data radio..

In preparation for APRS work at the Boston Marathon on April 17th, I've uploaded maps of the marathon course and some of the towns it passes through to: ftp.tapr.org in /tapr/SIG/aprssi/upload called baarun1.zip and another file which has an incomplete overlay of marathon aid locations: baa.bk.

When you unzip it, you'll need to copy maplist.ba to your aprs directory and change your maplist to maplist.ba (F-C-BA).

These maps come to us courtesy of W1KRU.

>radio anywhere else? I would buy it anywhere I could find it! hi hi

Isn't this the same group that pieces together GPS boards to TNC's? I'd figure most of us *could* piece together a radio in that price range rather easily! Try swapmeets, old HT's, old commercial rigs, etc. I see HTX-202's for less than \$200 on my BBS, and would think they'd perform much better than anything MFJ could produce. Of course, I don't have a high opinion of MFJ's equipment...

>They have been upfront on the phone and said there
>is a technical problem and they are trying to fix it. I'd rather finally
>get a good radio than one with bugs (don't laugh you guys! software is
>different... hi hi)

I'd rather get a good radio to begin with...

There is a lot of decent 2m radio gear out there, from lightweight RF deck boards that you throw into your own chasis to boat-anchor Micors. Maybe MFJ's radios will fit in a niche in the market, but they're not the only "only game in town", but then again, you may not find it "off the shelf"...

as was pointed yesterday, you actually see brand new HTX-202's for less than
\$200 in every radio shack store!

Seems to me a very good deal compared with all the mfj's story. The guys in
radio shack stores certainly know nothing about ham radio, but at least the
item is available everywhere from east to west coast.

By the way, I have the mfj 5/8 2m mobile antenna (magnet mount), and this
one performs well. The magnet looks quite small, but I never had any
problem, including at 75 mph (no, not on the expressway, I rented an
racetrack especially for the test, hi, hi).
For 25\$ it's exactly what we need to make an easily installed mobile station.

Concerning these hand helds I have a question: does someone know where I can
find the double jack connector used for the speaker and mike connection? I'm
tired of wiring two jacks at the end of one cable (and this is not reliable).

MFJ makes 'em already wired for your TNC and radio, about \$15. Most ham
stores stock them.

Jack

You guys just don't understand. MFJ was bought out by MicroSoft and has
imposed the marketing strategy of the Windows 95 product on the company.
This says that they must announce a product as "ALMOST complete, and will
ship soon". This announcement is made the day it goes into the lab for
development. This prevents you from going out and buying what is already
available. ;)
(this is still April isn't it?)

Rendered body type: text/plain

Well shonuff, 68 may crash on some VTG's and you may be seeing /raw*
without any lat/long. I think I found it for sure this time. Try
getting BETAX.zip on 410-280-2503 if you are having problems with GPS,
HSP or tracking stand alone trackers. IHope this does it....

If its ok, it also provides fulll FROM callsigns on the BULLETIN and the
TRAFFIC pages so you know who is sending what, without ambiguity...

207. Wow! good reaction....

Rendered body type: text/plain

Well, it's good to see the amateur spirit alive and well and following
a lead so quickly and decisively! I think we should now consolidate
all the facts about Doppler radar, the data providers and legalities
of dissemination to the masses.....

On the propriety nature (if any). If the data were taken from a
legitimate source, passed through APRS and put into a (better) APRS
over-the-air format, then we are NOT using their data format, we're
just gathering it and putting it out as OUR data. Does everybody
agree that that gets around any difficulties ??? Or I have I not
realised just how stupid corporate law is in USA yet?(!)

I think we should now await Bob's reaction, because he's 99.9999%
likely to be the one to code it.

A word of caution: I think this could be extremely powerful and useful
and we should take all efforts to do the data formatting RIGHT.

The 3D mode in APRS could be especially useful here if we can get
the right altitude return data.

Finally, we might not have to rely on either (a) paying for cable
(b) trusting the idiots at the local TV station (especially Ch10
Tampa!!!!!!) for reliable weather data.....

I hope so too. In 68 I was able to see \$GPRMC (_or_ \$GPGGG if I hit Alt-S,G,G).
I saw RAW* for the other strings. I hope to see \$GPGGG and \$GPVTG together
from stand-alone trackers to get position, altitude, course, and velocity.
Keep up the good work. 73.

For Fido mailers that want to FREQ the latest version of APRS, I've set up
the magic name of APRS at 1:109/239. This should deliver the current
version. The latest version of APRS is usually uploaded to my system the
same day of release, or next day after (right, Bernie?).

Try to use the full distribution name if possible, since I've set up a
wildcard (APRS*.ZIP) for the magic name, and it's possible that you may catch
me at a time when the newest version has just been uploaded, and I haven't
had a chance to delete the old version. In this case, the system will try to
send the newer version first, so at least you'll have a chance to abort the
FREQ if you see an older version coming your way after a successful transfer
of the latest copy.

Use a 100LX with a KPC3 to a TH-78. Just got APRS running on a 100LX but I had to disable the built in applications. No way will work on a 95LX - had one before the 100LX and know it pretty well - you will be able to do straight packet and act as an APRS node I suppose if you know the right beacon string.

ALL:

HOW DO WE INTERFACE GPS UNITS WITH THESE SYSTEMS????

WHICH ONES DO YOU SUGGEST??

<<

Folks this points out the need to chose carefully your local APRS frequency and work with the local coordinating body. I would hate for APRS to get the reputation that dx-cluster has earned by doing their own thing without regard for their neighbors.

>>

This is my point. Again, I know this isn't necessarily the place for this, but it's got to start somewhere. I think we need to DEMAND that the ARRL work towards forming a NATIONAL coordinating system. Regional, State, or Local ones won't work, RF knows no geographical boundaries. We need this especially now with our exponential growth. I am tired of hearing about how much of a mess this stuff is in, especially in CT with absolutely no coordinating body whatsoever.

>Isn't this the same group that pieces together GPS boards to TNC's?

As far as I know, PacComm is the only amateur radio manufacturer offering ham versions of an AVL terminal - a GPS pieced together with a TNC. We are not MFJ and are proud of our separate identity and reputation.

Regarding the ease of finding low cost 9600 radios - I'd refer you to the latest QST with an article evaluating some of the 'made for 9600' radios which turn out not so wonderful. Casts some doubt on the ease of taking a low cost HT and modifying it for 9600...

BTW, I've tried one of the MFJ radios and it performs well. That might be worth waiting for.

Rendered body type: text/plain

Hi and thanks for the five different instructions for subscribing. One of them worked and here I am. I tried using my Garmin 45 with APRS 6.6 last night and kept getting "bad nmea" in the upper right corner. I tried nmea-0183 version 1.5 and 2.0 from the GPS. I receive \$GP.... data OK on the comm screen.

Also, I found the USGS map vector data on the net but I seem to get the feeling from the APRS docs that the 2M data is what we have already for Rochester, NY, just main highways, and the 100k data is too detailed for mapping the whole county (I may have these reversed). Can I use the 250k data? or any other suggestion for using the map data?

Please forgive my mistakes here. I am used to reading Internet newsgroups so I can get a feel for where the FAQs are and usually see an answer to my question without having to request one specifically.

Were I to guess, I'd guess the -45 is sending out more data than the program's expecting, or sending out at least one variant Bob's not programmed for. Good guess, Bob?

> Also, I found the USGS map vector data on the net but I seem to get the

> 250k data? or any other suggestion for using the map data?

The 1:100k data is uable for mapping whole counties, provided you don't get too detailed. I use it for grabbing data for interstate and US hiways, State routes/hiways, and major routes for whole county mapping. For more daitailed area maps, I use each separate quad, and only work within that are for the major and minor city streets. You have to be obsessive-compulsive about defragging both by program and manually, and then you have to go manually and delete a lot of extraneous points that the method of input USGS uses incurs.

Hope this helps.

APR REPLY: I would say your HAAT will be negative. Take your 50 foot height above sea level, and subtract the height of the hills from it and you will get a very large negative number. Since APRS only allows for positive heights, use 0. I would also then give it a directivity in the direction of the 4th missing hill...

I dont use a formula. I just estimate how high my antenna is above AVERAGE terrain out to my visual horizon. Just use common sense. (although you wouldnt beleive the people around here that use sealevel, an absolutely useless measurement unless you live on a FLAT ISLAND!

>Oh and, how important to APRS DF is the AHAAT setting?

Normally it is computed by locating your site a topo map and drawing 8 equally spaced 10 mile radials from the site (N,NE,E,SE,S,SW,W,NW). Then you dot the radials at one mile intervals and record the elevations at each interval. (This is good for estimates, but the FCC requires at least 50 points per radial.) Next you compute the average elevation along each radial, then, compute the average of the radial averages. It can be time consuming when done manually like this. For APRS you might just want to take an educated guess. Topo maps can be purchased from the USGS. You might check with local outfitters and camping stores too.

I recall seeing something in one of these TAPR sigs about a service on the Internet where you could do this automatically with email by providing your lat/lon. Maybe someone else can advise.

Rendered body type: text/plain

Saw an all USA packet bulletin chastizing the periodicity of APRS beacons in SoCal. The guy made a good point about beacons on SHARED frequencies. In version 6.8b (when finished) will increase the maximum beacon time beyond the current 15 minutes. And will also take in to account whether an operator is present or not.

MAPS: I asked W7KKE to take a look at the CONV100 program and its inability to handle LARGE numbers of initial points from a CDROM file. He modified the array size and reports he can now process a file that results in as many as 15,000 points. He has posted in on ARS 410 280-2503 as CONV100C.bas

Also 68b will have the ability to REPLAY a BK file. This trivial change means you can go replay a BK file to find out where someone lives, without having to LOAD the old BK file and therefore loose the present picture...

I have reports of some bugs that I need second opinions on.

- 1) one station says his rain gauge does not work
- 2) Another is seeing too many posits saved in his track history file
- 3) Another says the fix in 67a that PREVENTS autologging of U-II data does not always work
- 4) Blue screen does not always come up on a connect. (I have seen this one too, and I agree it is a problem).

All of these were reported in 68a but they also say they have been there for a while...

Bob,

I take (and took) issue with the ALLUS PACKET bulletin regarding too many APRS beacons.

I believe that the author of that bulletin confused 'people running APRS' with 'people with APRS position info in their BTEXT'. My house is at 1620' at the foot of the San Gabriel Mountains above Pasadena, and I have a clear shot all the way down to San Diego (125 miles). My packet station runs 24 hours a day, and I have ample opportunity to see what goes on on-the-air. There is NO problem with an overload of APRS packets on 2m packet in LA (users ARE starting to add APRS position info to their beacons, which I think is GOOD!). Even the oft-tossed 'too many user beacons' complaint is, in my opinion a big red-herring. The worst offenders in LA are the BBSs and Nodes themselves, beaoning every 10-15 minutes (as if no one knows they are there already). At least now Nodes and BBSs are starting to put APRS position info in their Beacon strings, which will aid in producing maps of the local network.

Regarding 'shared frequencies,' this discussion of APRS as a new mode puzzles me. It is primarily 1200bd AFSK using FM radios. I see APRS as a new USE of packet, not a new mode, and do not view APRS as 'sharing' the frequency any more than keyboard-to-keyboard users 'share' the frequency with a BBS. I am a SysOp of a major LA-area packet BBS, and I am glad to see APRS in use here. To me, I see APRS as a unique use of the capabilities of amateur radio, rather than simulating other modes of electronic communications.

I would highly recommend you NOT fix something that is not a problem.

73,

Greg (who will someday actually connect APRS to a radio, instead of mooching off of friends)

Nice attitude. I wish APRS was better understood by all involved. In San Diego, the ARRL 00 warns us NOT to beacon on 145.01 with APRS information!

And he says APRS *must* be on 144.990 to be coordinated. Well this is turning out to be a big deal because 144.990 is also coordinated for 9600+ experimental work. We'll see what happens.

Hi Bob,

Need some decision making information here.. Last year near the end of the Hurricane season I started to enter the location of the Hurricanes, I am sure you were able to see my entries at your location as I sent them far and wide. I was entering the locations finally near the end without speed and direction except in the comments as, well if you ever plotted hurricanes they never go where they say they will go but probably end up going dat-other-way as the last one did last year..

Now, I noticed that N2CZF was entering them also but would do so only about once a day with speed and course which can confuse everyone in the direction of the storm especially if the storm turned and went that other direction.

Now, I understand that the Hurricane Center is ON LINE now but I have read that they will be receiving the hurricane reports but not issuing anything.

So, my question to you, oh great wize one, should I pick it back up again this year or just forget about it.. It is fun to watch the hurricane and where it is going and follow it..

What do you think, Bob?

You have to build an interface cable as follows:

You might be able to find a better schematic in your doc. Use the one for "ICOM 2AT" style radios if it is available.

252. Mobile SSID numbers

Hi all!

I've seen people being reminded that mobiles sending gps data should set their SSID to <call>-9. Is this just a standard that we're all trying to adhere to? Are there other SSIDs used for other types of operations? Are there technical reasons for this? Can someone knowledgeable full me (us) in?

>

APR REPLY: APRS was designed so that who ever has the latest info on an OBJECT, should enter it and it should overtake any previous entries. But since N2CZF posits are comming in via HF gateway, your VHF posits will NOT cancel his, unless he hears yours. In a case like that, I would enter yours as well, but choose a different exact NAME so that his doesnt cancel yours. I would also say to PUT THE CSE/SPD on them. That is the best data available at the time of the posit. BE SURE TO PUT THE CORRECT TIME OF THE POSIT so it DR's properly. Subsequent reports can allso use a slightly different name (SSID?) so that viewers can see present an some of the past posits...

APR REPLY: The -9 is required for STAND-ALONE-TRACKERS that want to look like a CAR. all of the other SSID's define other mobile symbols (see SYMBOLS.txt). For APRS mobiles, however, any call can appear as any symbol. But in general, the -9 is sort of an eye catcher to suggest that the guy is mobile...

Dear Mr. Bruninga,

I read your earlier message showing unproto command. I actually typed unproto aprs via hf1/aprs via vhf1 and entered. My unit transmits on HF only. Is my format incorrect? I have successfully gone into ops then comm and then tnc and typed tildea and make it go just to hf. But again am trying to have it do both radios. Or is this not possible and I have to do it one or the other? I am also reading some stations at bottom of my screen however, they are not appearing in place on my map. Why is that? On the updates which I subscribed for, do you send them automatically or do I need to request them from you? Thanks for your time. Your program is sure keeping me off the streets. Harry KD4MPC

After watching 68a working its feet off on my camputator I just happened to hit the "R" key, hey! there was mail for me! Then I hit "B" and there were two new bulletins.. Please note that I hit the keys and LEARNED only then that I was being presented with something or that something was WAITING for me!

If this program, as fine as it is, is going to be used for any type of emergency communications or warning thereof, there should be some form or methode of advising you, the SYSOP, that there are new bulletins or there is mail for you just by watching the main map screen! Either two asterisks at the top of the screen, or a Upper Case "R" or "B" being displayed somewhere within the top 3 lines of the map screen notifying us that there is something for me to READ and READ NOW

The way it is now in 6.8a is is NOT suitable as a way to communicate between other sysops during an emergency, only to show objects, mobile or otherwise. I am sure now that Bob realizes the implications of what I have said will look it over - again, what else does he have to do this weekend - anyway?

Happy Easter or Passover to everyone....73 de Rod

Attending the 1995 Dayton Hamvention? Time's running out to register
for PACK*BASH!

What?

A new event for the digitally-inclined ham, featuring:

- * Buffet dinner (with cash bar)
- * Dewayne Hendricks, WA8DZP, speaking on PCS, SS, FCC, and other acronyms
- * Bob Bruninga, WB4APR, speaking on the Future of APRS
- * Prize raffle
- * TAPR special interest group meetings
- * "Birds of a Feather" gatherings

When?

Friday evening, April 28, 1995
Dinner starts at 7:00 pm
Speaker at 7:45
Meetings to begin after the speaker

Where?

TJ's Restaurant
2462 Dryden Road, Dayton
(Dryden Road exit, I75 -- across from the Holiday Inn)

How?

Dinner requires advance registration and payment BY APRIL 24th, 1995.
Seating for dinner only is limited, so register early! The cost is
\$16.00 per person, tax and tip included.

All amateurs are welcomed to attend, enjoy the speaker, and
participate in the meetings, although only those purchasing a dinner
can eat.

To register, contact:
PACK*BASH
c/o TAPR
8987-309 E. Tanque Verde Road #337
Tucson, AZ 85749-9399

Phone: (817) 383-0000
Fax: (817) 566-2544
Internet: TAPR@TAPR.ORG

Visa/Mastercard Accepted

Who?

PACK*BASH is co-sponsored by TAPR -- Tucson Amateur Packet Radio,
the national leader in digital communication -- and the Miami
Valley FM Association, Dayton's packet radio club.

For further information, contact TAPR, or email packbash@ag9v.ampr.org or

263. Saving Digi Path

From: K2ADJ@aol.com
Date: Sat, 15 Apr 1995 17:01:23 -0400
To: APRSSIG@tapr.org
Message-ID: <950415170122_84344019@aol.com>
Rendered body type: text/plain

Bob, I don't know if I am doing it wrong or I may have stumbled on a problem with 68a... Let's hope it's me, hi.

When you hit the digi path, you hit O-S-D-S to SAVE a digi path, two boxes show up on the screen informing you to

Path NAME and digipeaters
Enter TWO letter path followed by , and the digipeater list.

Well, I tried that with the "," and it was not entered into the Config.APR file properly, the whole line resembles the plain digipeater path. In fact I could not even download it from the config file..

I then reentered it again, but this time I replaced the "," with a ":" (colon with no spaces) and it took just like it should and was able to download it when I wanted to run it again.

So, it is me or the program, I am really not sure, hi..

264. Question & Suggestion

From: W2H0B@aol.com
Date: Sat, 15 Apr 1995 20:24:19 -0400
To: aprssig@tapr.org
Message-ID: <950415202417_84495404@aol.com>
Rendered body type: text/plain

Mainly for you Bob, WB4APR:

My question relates to the PHG rings around stations... If indeed the ring is accurate and denotes the transmitter range of the site, how does it relate to the receiver? By that, I mean to ask, if I increase my xmtr's output, the ring will grow, but really doesn't mean that the receiver started to receive better, does it? I assume the transmit and receive aren't related?

Second, If one stations's ring intersects another's without actually including the other station, does that mean they can communicate? Or, must one station be inside another station's ring to be able to communicate with it.

Now... a suggestion... when using the 43-line text, the characters get chopped off at the top where the boxes surround the text. Would it help if the boxes were eliminated and allow the text to be displayed in the color of the box? Hmm... I like the 43-line text otherwise.

While I have the floor(!)... I can't remember how far back I noticed it, but it seems that in the various betas of the 6.8 generation, the speed that the computer talks to the TNC has been affected to the point that I get a lot of " *TNC not responding* " messages in the Longitude line of the upper lefthand box. No error messages and no crashes... the program seems to continue to work properly... just keep getting this annoying TNC message that I'm sure isn't really hurting anything else. Any ideas?

Thanks for letting me ramble... I've got more later!(Hi)! 73 de Boyd AR

I get this now too, and a lot of the other users in my area started seeing it with 6.8. It doesn't seem to hurt anything. Probably indicates a failure of

the TNC to respond during a single attempt to communicate with it, but the notice doesn't go away when things are normal again.

Message-ID: <199504161503.IAA15648@warp10.smartdocs.com>
Rendered body type: text/plain

Hi.....

I have heard that the FCC will be looking into this proposed limitation of methods to spread information via Amateur Radio....

Although as I understand the specific goal of this proposal is to limit ARRL generated messages and CW Practice on the HF Bands, if it succeeds can it or similiar decisions be applied that limit the transmission of APRS, Beacons, CQ Calls, or any other one way transmissions that are an everyday occurance in Amateur Radio.

I will admit that I have not read or studied this proposal, however, from what I have heard discussed about it...This proposal needs to be soundly rejected.

Should we be concerned?

268. APRS EYEBALL AT HAMVENTION

From: AA8JK@aol.com
Date: Sun, 16 Apr 1995 12:08:01 -0400
To: aprssig@tapr.org
Message-ID: <950416120800_84928966@aol.com>
Rendered body type: text/plain

After much deliberation, it has been decided the the 1995 APRS EYEBALL will be held on Saturday, April 29, 1995 at the Mallard Landing Clubhouse in Beavercreek. This is the same location as last year's Eyeball.

Although many people sent a vote for a Friday Eyeball, TAPR and the Miami Valley FM Assoc. are hosting a dinner/packet forum for the packet crowd on Friday night. To avoid conflicts, I have decided on Saturday for the Eyeball.

Pizza and soda will be available for purchase at the Eyeball. Plans at this time are to take orders for pizza when one would arrive at the clubhouse.

Pizza and a few sodas should be in the \$5-6 range.

FACTS ABOUT THE 1995 APRS EYEBALL

PLACE:

Mallard Landing Clubhouse-Beavercreek, Ohio (East of Dayton) Just west of the intersection of Kemp and North Fairfield Road.

TIME:

The Clubhouse will be open after 6 PM on 29 April, 1995. Pizza orders will be taken until 7:30 or so. Please RSVP if you want some pizza, but might be a little late.

TALK-IN:

We have been given permission to use the 145.41 (-600) repeater for talk-in for Saturday night.

APRS STATIONS ON THE AIR IN DAYTON

I will have my gate up and operational for the Hamvention. AA8JK-4 is located south of Dayton in Miamisburg. AA8JK-4 is also WIDE and a WX station. We may have another WIDE close to Hara for Hamvention week.

Maps and additional information will be available at Hara.

I look forward to seeing all of you at Hamvention and at the Eyeball!

271. APRS/Ultermeter II WX Station

From: jkeck@smartdocs.com (Jim Keck)
Date: Sun, 16 Apr 1995 11:55:29 -0700
To: aprssig@tapr.org
Message-ID: <199504161855.LAA20162@warp10.smartdocs.com>

Rendered body type: text/plain

Hi.....

After obtaining some of the items to put together a remote WX station, I have come up with a few questions and concerns that I would like to throw at somebody who has already been there and done it.

I have learned that the Ultmeter II only gives the present conditions and the highest it has recorded since last being reset. That is unless one purchases that companion computer program and appropriate cable that the company offers as an optional item. So that is where I am at. Now I have the capability of seeing Highs and Lows during any period that has been recorded....

When the unit is placed at a remote location, it appears that this capability will again be lost, unless a piece of software exists that will allow the saving the APRS WX transmissions and ability to recall those readings for later use and/or graphing them to provide more useful information.

Your recommendations will be greatly appreciated.....

Rendered body type: text/plain

This is in reply to Jim Keck (jkeck@smartdocs.com) re: the U-II...

Hello Jim... your problem really isn't a problem in a way. Yes, the U-II will save the HI's and LO's of Temp, Rain, Wind Speed until reset, but APRS will only save the Rainfall for the last 1-hr and 24-hr periods. After that, APRS resets itself and only reads what U-II subsequently sends it.

Sure, you could walk over to the U-II and still read the Hi's and Lo's, but APRS doesn't care after those 1-hr and 24-hr periods have "expired". That's the R00 and P00 parms you see. So no RESET of the U-II is necessary if it is remotely located. I am wrestling with this now though... I would like to move W2HOB-14 closer to the NJ coastline but fear that it would have to be reset because of some unthoughtof glitch which will lockup the weather station and NO OUTPUT would come forth! It has happened and was easily resolved by walking across the room, disconnecting the battery and power plug and bringing power back to it... kind of a U-II "re-boot", but... this has nothing to do with the weather string (in hex I think) that comes from U-II to APRS (COM2: at my place).

APRS will continue to use that string and cause it's own "timers" to use "new" data from U-II. Now - have I made this as clear as mud on a foggy day??

There is a program called AUTOWX, version 5.?, that is fed by U-II and outputs, on-the-air, in APRS format so all monitoring stations will plot that station on their maps just as if APRS was sending it. Now, a station could connect TO that station and read HI's and LO's and then disconnect. It's on many of the BBS's and could be on CompuServe... not sure about AOL. Obviously, if you're running that code, you have no map to look at since you're running it and not APRS. Hmmm... wish we could have it both ways, eh? Have fun es CUL.

>

> Should we be concerned?

Jim, I don't know if the proposal will affect APRS, or anyone including the ARRL of course, because it is very easy to get around this prohibition. APRS stations could send the same information to a particular station, rather than not, and any other stations which monitor can also use the information. No license is required to operate an APRS program in receive only, monitoring what is on the air, just as no license is required to fox hunt using DF equipment.

The reason for concern ought to be the lack of enforcement of existing rules by the FCC. The problem stations wouldn't be problems if the FCC would actually exercise their sole authority and enforce the long existing regulations a bit.

Attempts to curb the problem with more rules is a misunderstanding of the cause of the problem, and so the actual solution. But this is far afield of APRS, so I'll stop here.

The event that occurred that caused the unit to lock up might have been the result of a very near massive static electric discharge (near lightning strike). I've had my station up for about a year, and had this happen once. Took about 2 days to figure out what happened, and how to correct it.

Hi,
I would also like to third the fact that I am getting the TNC NOT RESPONDING in the upper right hand corner, more then I ever did and the radio is transmitting. Im sure a small glitch that can be taken care of in the next update.

Ron N9QGS
U-II reporting station in Streamwood, IL

In regards to the message above saving WX conditions, there is a program called AUTOWX, and it will do just that, and you can inport that into the U-II TSR program and graph it them also, but APRS will also I believe save your WX data also, but not in a format usable by other programs but you can do a REPLAY under FILES (F) command.
Hope this helps.

APR REPLY: Its a problem to show both XMT and RCV range. Impossible to do it with just one ring. So interpret it as a XMT ring. If the transmitters are both nominally 10 watts, then the XMT and RCV rings are the same. With this design, the rings only need to intersect for COMMS to be possible, but take it all with a grain of salt!

> computer talks to the TNC has been affected to the point that I get a lot of
> " *TNC not responding* " messages in the Longitude line of the upper

APR REPLY: This can also happen each time a PACKET comes in at the same time as APRS is checking the TNC. Is frequent occurrence on busy nets... As long as its working, ignore the message.

Not a problem.

aprs uses 640*200 mode in cga which is a b/w mode.
If you want colors with a cga display, you have to use 320*200, which is not enough for the maps in aprs (and so not available).
Concerning the cga display, i also have to use (what a pity!): we have in cga the same problem as in vga 43 lines; the characters at the bottom of the screen are "eated" by the box surrounding them and quite difficult to read.

> transmissions that are an everyday occurrence in Amateur Radio.
>

APR REPLY: The proposal should be soundly rejected. Having studied every possible method of networking and interlinking data and human communications in the NAVY, we kept coming back to the simple BROADCAST

as THE MOST EFFECTIVE way to disseminate information quickly and efficiently. ON a tactical net, EVERYONE listens, and the station with new INFO transmits it to the group! As soon as you start ACKing receipt by every RECEIVER, you end up spending more time ACKING then sending new info. This applies to plain ole'voice nets as well as digital.

By the way, this is what separates APRS from DX clusters, and CONVERSE nodes. APRS sends and does NOT expect an ACK. To give some confidence to message delivery, there are two mechanisms: 1) Redundant but decaying transmissions to account for garbled or collided packets, and 2) heart beat signals from all receivers indicating that they are ON LINE and therefore probably receiving...

P.S. For those that complain about APRS redundant transmissions, suggest that they monitor a DX cluster or CONVERSE node, and count the number of total packets transmitted (to get the same one-liners across) and I think they will count a LOT more packets! hi hi

> this capability will again be lost, unless a piece of software exists
> that will allow the saving the APRS WX transmissions and ability to
> recall those readings for later use and/or graphing them to provide
> more useful information.
>

APR REPLY: Yes, and no. The U-II internally saves the highest and the lowest (I believe, I don't use it that way...) but all that APRS does is take a SAMPLE reading every N minutes. This is an instantaneous SAMPLE and will only show the conditions at that instant. Same thing for a remote U-II. Only instantaneous data.

But APRS can be made to save all of these reports to disk in a track history file by simply turning the POS filter off. Then you will get a trend history of all of these samples. This should work for remotes too. (someone with a remote can confirm this?)

Finally, hold your breath, Peet Bros may be doing something to help us...

Rendered body type: text/plain

I talked to W7KKE after viewing some frustrations by individual map makers about the inability of CONV100b.bas to handle large numbers of points in dense areas. He has repsoonded with CONV100C.bas which eliminates the problem. He says it easily handles up to 18,000 points and he still has not been able to crash it...

So now, using CONV100C and then MAPFIX68 anyone (with a lot of time on his hands) can make street level maps. Here is what Ken, W7KKE reports:

To get the data down to a usable (under 3k points) map file at street level, he usually targets a 4 mile range map. In dense urban areas, this may only be a 2 mile map. The amount of time to do this takes an average 8 hours (and he is well up the learning curve!)

But he also has a digitizer (11 inches square) and concludes that the CD ROM approach is slightly better for him cuz he doesnt have to find good quality paper maps.

APRS CONCLUSION: Dont overlook the ability of everyone with a GPS to simply save a track history file of where he drives and then replay that in MAPFIX68 to draw his own favorite roads onto existing maps. Having a street level map is impressive, and is ideal for a public service event contained within a few mile area, BUT street level detail is not important when mobiles are moving above 30 MPH and stretched over dozens of miles. They will pass thorough a 2 mile detail map in only 4 minutes...

So before you get frustrated with maps, decide what your overall objective is. Once you decide that CDRom data is for you, then go for it! Its fun and adicting! (ugh)

I played with aprs all the week-end so here is a few comments:

I understand that transmission of redundant information (in the case of aprs) is much more efficient that usual converse mode. But this is not a reason to send more packets that needed. I see a lot of aprs beacon packets here that seem useless, ie contain only a comment like "aprs 0.0x in line". I would say (or perhaps we use the beacon in a false manner?) that a position packet with some comment is enough to report a fixed station. Also, the actual usual timing of 15 min is too small i think. Please understand me: i do not care of these complains about aprs cluttering frequencies with beacons, but in respect for everybody, and for the efficiency of the aprs network, we have to send no more information than needed.

Concerning aprs maps: i found some times that the map becomes hard to read when there is a lot of stations. An optional mode with only small dots replacing all the big icons (houses, cars, digi , towers , apple) would make them more readable. We just need a color code to distinguish between mobiles, fixed stations, digi, wx....

One last question: what about this enigmatic file in the doc called voxrptrs.txt. The content looks like very interesting! any news on this topic. (for everybody except Bob and Keith: you did read this file did you?).

I'm doing some work with one of the labs on campus here at Texas A&M, and
 we're about to make differential GPS (mapping grade, not survey grade)
 available to the community. One hang-up appears to be the ready availability
 of USER receiver hardware. We're planning to encode it with a standard TNC,
 so what we need is something that puts out narrowband audio to feed to a
 receiving TNC.

Any suggestions as to where we can send potential community users would be
 appreciated. We, too, will have to get a couple, but we don't have to supply
 the world!

Alright, now for some words from a pen and pencil map maker,
I tried the CONV100C.EXE this weekend, and it works, nicely, if you want a
lot of local detail in a small area. I used it for a 1.5 mile urban area at
19200 point per degree. Total time spent on the project was 5 hours. In my
opinion, this will be the way to go for any urban mapping project. If I were
to do it manually, it would have taken about 16 to 20 hours, and not have been
as good. (2400 ppd vs 19200 ppd).

Word of warning - it ain't easy to get the hang of how to do the maps.
(could be old dog vs. new tricks) But, once you figure it out
(the instructions are literal in there meaning) and get a few under your
belt, it's not bad (the 1:100,000 that is, the 1:250,000 still does not have
the details I need). - Map making is fun. Give it a try.

Well, I've been hitting another snag! I have some 1:100k DLGs from the Tx
DOT, which are updated, corrected USGS 1:100k maps. Of interest, they appear
to be in northing/easting format rather than lat/lon.

'Nother point. Bob, I've not pulled 100C down yet, but I will look at it. It
appears that the CONV100B program now wants the files in "optional" format.
Now, I hate to be this way, but last time *I* looked at the CDRom, there was
only one format. The STD and OPTIONAL formats are and artifact of the FTP
site. So, when I follow the instructions to process the files to delimited
format, LIKE THE ONES ON MY CDRom SET, it doesn't work!

OK. I give up. Where have I lost my mind? If someone sees it, please let me know!

>
> Hi all,
> Would it be possible to add, automatically as some mailing lists do already,
> to put how to UNsubscribe at the end of each msg?

>From where I sit, that would add a considerable amount of overhead to EACH MESSAGE. The lists I'm familiar with that do that are infrequent update services, not something as active as this list... a weekly news update, for example. Appending that info to each message would add data that has to be stored on the host machine here, and with the number of users we have, and the number of messages this list serves, that amounts to a lot of data.

> In case you want to know, I want to know, how to UNsubscribe. Thanks for
> your time, Bill

Please, PLEASE save the info message that tells you how to unsubscribe that you received when you signed onto this list. Or, remember that virtually all of the automated lists have an address of listserv or listproc on the machine that hosts the list. Rendered body type: text/plain

You are correct. CONVI00 has to have the CDROM data in OPTIONAL format. Its sole function is to convert OPTIONAL format to GRAPHIC format.

This is because I originally wrote MAPFIX to operate on the GRAPHIC format supplied with the 2,000,000 CD ROM data.

SO, the problem is that 100,000 CDROM data comes in TWO formats. You must specify the OPTIONAL format when ordering your CD ROM... Hope you didnt invest in a lot of the wrong ones! hi hi... If so, then maybe you could write a new program to conver STANDARD to GRAPHIC format. hi hi

299. MYA Relay

From: MikeKE6EGK@aol.com
Date: Tue, 18 Apr 1995 12:36:43 -0400
To: aprssig@tapr.org
Message-ID: <950418123641_87260167@aol.com>
Rendered body type: text/plain

QRM is always a concern of mine. As the local APRS community (NORCAL) has been growing by leaps and bounds, the local frequency used by APRS (145.010) is rapidly becoming congested. One problem I have seen is the MYA (RELAY) that is built into the APRS program. I know that by going to the blue screen mode (O-C-T dumb terminal) your MYA can be changed, that is if you remember to change it. Before version 5.0 was released (ancient history now) I could go into the CFGxx.APR file, with a text editor, and change my MYA to something other than RELAY, and each time I started the program it would automatically set the MYA to what I changed it to in the CFG file. Now the problem is that since version 5.0 this technique has not worked. I am back to manually resetting my alias via dumb terminal. I know that the word relay appears in the newer CFG files and have changed it several times in several versions, and when starting up the program MYA RELAY is still there. (not just on my screen but in my TNC) Is there a way to change the CFG so that I do not have to remember to manually change MYA?

300. Announcement: Map Making Program

From: Keith Sproul <ksproul@hardees.rutgers.edu>
Date: Tue, 18 Apr 95 12:50:30 EDT
To: aprssig@tapr.org
Cc: msproul@arn.net, sproul@eos.ap.org
Message-ID: <CMM-RU.1.4.798223830.ksproul@hardees.rutgers.edu>
Rendered body type: text/plain

As most of you know, I write the MACINTOSH version of APRS, called MacAPRS. This program is fully compatible with the PC version as far as the on-air protocols go. Bob and I keep in touch and make sure that anything done over the air is coordinated between us.

Over the past few weeks, there has been a LARGE discussion about how difficult it is to create good maps on the PC. Those that have seen BOTH the PC version and the MAC version have been very jealous of the Mac's Map creating capabilities.

In fact, several people have asked "Why don't you create PC maps?" or "I wish I could create maps that easily!"

Well.. I am working on it!!!!!!!

I discussed this with Bob last night, and although I have told a few people about this, I had not given a lot of details. Here goes the details..

So far, the MacAPRS program has had the capability to create MAPS from within the program. It could convert PC maps, it could create maps from the USGS 1:2,000,000 CD (what most of the maps are from) It could also create maps from the USGS 1:100,000 CDs (See the Feb issue of 73 magazine for an example) and it could create maps from a couple other sources of map data. In fact the stuff that is supported or is being worked on is growing almost weekly.

The problem with this 'GROWING' was that there was getting to be a LOT of stuff in MacAPRS just for creating and editing MAPS!! About a month ago Mark, KB2ICI, (my brother and co-author of MacAPRS) and I decided that it might be a good idea to separate this map making/editing out into a new program.

So, I am now announcing MacMapMaker (MMM for short). This program will do ALL of the current map stuff supported by MacAPRS, it will allow EDITING of the maps and will have the ability to create map files for the PC version of APRS.

MacMapMaker will have LOTS of editing capabilities, color selection, line smoothing, line adding, deleting, dynamic point reduction (For the PC maps) This will show you the CURRENT map, show you what it would look like at the next level down, i.e. data reduction, etc, so that you can keep playing until you get a map with small enough number of points, but high enough detail to get the job done.. You will be able to merge data, delete sections, most anything you could think of in editing/creating maps.. It will also support different coordinate systems such as Lat/Lon, UTM, State-Plane, and the different GPS Datums available.

To be able to do a lot of this type of high-end graph theory takes a fair amount of work and effort. This program will NOT run on a Mac Plus, it will require a color Mac and at least 8 meg of memory, but this is what you need to be able to this level of graph theory and data reduction..

The base program will probably be demo-ed at Dayton, and I expect to have PC map creation done sometime this summer, or at least by the ARRL DCC conference in Dallas in September.

MacMapMaker will be able to support most freely available map data bases and will also be able to use GPS input for creating maps of local areas..

Currently supported or being worked on:

- USGS 1:2,000,000 (the YELLOW CD)
- USGS 1:100,000 (the RED CDs) (14 CDs of the US)
- WDB & MWDB World Data Bank (publicly available, CD & Internet)
- DCW Digital Chart of the World (4 CD-ROM set)
- Tiger Files US Census
- USGS DEM Digital Elevation Data (For CONTOUR Lines)
- Named Location Database (147,000 Named geographic locations in the US)

Another nice thing is that a LOT of this data is available FREE on the Internet.

(If you know of other publicly available data, please let me know, I will incorporate anything I can get my hands on...I am working on a few more than listed above, but these are the ones I will support first..)

As you can probably guess, MacAPRS is also continuing to grow at a rapid rate!!

The MACINTOSH Operating System has a feature called the SPEECH MANAGER. This has been available for a couple years and now comes installed with the new versions of the system. This SPEECH MANAGER makes it VERY easy for any program to have SPEECH output.

MacAPRS 1.5.0 now has SPEECH output for two different things. When a NEW station appears, it tells you the CALL SIGN, and if you get MAIL to YOU, it says "MAIL FROM <the call it is from> <the text of message>" i.e. "Mail from WU2Z Hello This is a test" The voice is select able, so you can have it in a deep male voice, or a nice sounding female voice, or one of the other sample voices available.

MacAPRS 1.5.0 has the Map Creation stuff taken out of it which makes it somewhat smaller. (Although, Mac's DON'T have a 640k limitation hi hi). This does make it better for the low end Mac's..

As stated above, the MAP CREATION stuff has been moved to a new program called MacMapMaker..

Version 1.5.0 also has several other new features, but mostly Mac specific, so I won't go into detail here.

Version 1.5.0 will be available at Dayton and will be up on the FTP sites on May 1st.

=====

DAYTON 95..

Bob Bruninga and I will be at the TAPR PacketBash Friday night and we will be at the APRS EYEBALL Saturday night.

During the day, We will be in and out of the PEET-Brothers Booth.

If any of you are going to be at Dayton, please look us up... Also, tell us that you are on the APRSSIG mailing list

Standard vs Optional data formats..

On CD, the ONLY section available in STANDARD format is Section 4, which is FLORIDA..

I have written all of the code for the OPTIONAL data format, and have done some with the Standard format, see my previous message about MacMapMaker.

This program will eventually support the STANDARD format also since this data is available on the Internet..

I now have to go back to TxDOT and get them to produce it in the optional form. I guess that's no big deal. it just sets a project or 2 back a couple more weeks.

Message-ID: <Pine.SUN.3.91.950418173244.22370B-100000@pinegov>
Rendered body type: text/plain

Greetings!

By way of introduction, my name is Kevin, amateur call KD4UYR, in

beautiful Seminole, Florida. I finally made it to the internet thanks to my local government. I operate the West Central Florida GATEway on 30 M in conjunction with my colleague Bob, W4/G3ZFJ.

I would like to meet/exchange ideas with other APRS users involved in WX spotting/SKYWARN/etc. We have been using APRS here in Pinellas and Hillsborough Counties of Florida since version 1.0....yes 1.0.

We have two dedicated Wide Area digi's supported by county government. Each is located on top of the County Courthouse in each county.

The North Florida Section of ARES is also looking into APRS to replace their existing packet network of gateway stations.

My ultimate goal is to link all the major urban centers in Florida via APRS on a full time basis with VHF digi's in each of those areas. Usage would be intended primarily for WX and ARES type applications but, of course, these routes would be available for normal amateur use most of the time. As a bonus, visitors, which abound in our state yearlong, would have instant APRS access to the rest of the free world via the 30M gateway.

We currently transmit all MIATORTBW, MIASVRTBW, MIASWSTBW, and NHC products intended for use by the public over the 145.790 APRS frequency via packet in real time. In addition we have three part time and three full time weather stations on line.

I would be interested in any ideas or usages for APRS that we have not yet stumbled upon which might assist in this venture.

305. APRS Maps from Those CD-ROM Atlases

From: miles@mail.utexas.edu (Miles Abernathy)
Date: Tue, 18 Apr 1995 21:30:09 -0500
To: aprssig@tapr.org
Message-ID: <v01520b00abba24f2d0c6@[128.83.204.109]>
Rendered body type: text/plain

I have learned in this forum that those commercial CD-ROM atlases and street maps are (effectively) encrypted, so they can't be used for APRS. I just saw the following exchange in another group, and realize it might point someone toward a way to use the CD-ROM's.

```
<from sci.engr.civil>
>> I need to find sources of translation software to allow me to
>> translate publically available maps in
>> TIGER, DLG, DEM and other formats to DLG format for
>> importation into AutoCad 12. TIGER is
>> the format used by the US Census Bureau and DLG and DEM's are
>> the formats used by USGS.
>
>A good place to ask would be comp.infosystems.gis
```

Good luck!

> >
> > A good place to ask would be comp.infosystems.gis

I'll check it out, but the files tend to come out in STANDARD rather than
OPTIONAL format.

So, Bob, why did you go with optional format? Was that the CD available at
the time?

One other note: seems like I recall seeing something indicating that the
delimited files after unblocking were what's on the CDROM. Am I confused
again? it's been one of those weeks, and the drugs haven't kicked the sinus
infection yet, so I'm not always sure of what I think I'm seeing :-)

To: aprssig@tapr.org
Message-ID: <CMM-RU.1.4.798293248.ksproul@old-hercules.rutgers.edu>
Rendered body type: text/plain

> So, Bob, why did you go with optional format? Was that the CD available at
the time?

The 1:2,000,000 CD has STANDARD, OPTIONAL, and GRAPH format data. The GRAPH
is by FAR the easiest to use since...

I said in a previous msg, the 1:100,000 scale USGS CD-ROMS are available ONLY
in Optional EXCEPT for the FLORIDA data which was the first one done..

I support Optional data, and have done some work on the Standard format, but
it is lower on the priority. Since more and more of this data is becoming
available on Internet, the STANDARD format may become more viable..

Please go back and read my big announcement about MacMapMaker which will
solve a lot of the problems.. It will be able to convert most of these data
types and will be able to produce PC maps. It will have FULL editing
capabilities and data reduction capabilities..

Keith, Thanks for the reply. Unfortunately, I have unix and PC platforms
available, and no Macs. So, I'm back at square one.

Guess I'd hoped for a slightly easier solution, since I'm both a full-time
student and a pretty full-time research associate, but it looks like I just
added another programming project, unless I can get TxDOT to reformat.

309. Re: [APRSSIG:857] Announcment: Map Making Program

From: Emmet2@aol.com
Date: Wed, 19 Apr 1995 08:56:56 -0400
To: aprssig@tapr.org
Message-ID: <950419085653_88391019@aol.com>

Rendered body type: text/plain

I'm glad you are separating the map making capabilities, it is not likely you will need this while you are operating, so nice to have it separate. I would also hope that this might reduce the RAM requirements of the MacAPRS application. I would think if you remove a segment of the code like that it would reduce the overhead somewhat.

Another idea, that I didn't see mentioned there, is that I would like to eventually link my GPS (Garmin-40) to the computer and make a map by driving around. To that end, it would be nice if it had a GPS input mode allowing you to (a) dl waypoints, (b) feed constant input from GPS. Then you might want to process the data and add labeling, color, and other elements. Might be nice to also have a merge mode so you can do it in segments if you are building an area map.

Thanks for considering the ideas.

310. AFOS Bulletins over APRS

From: Kevin Heyboer <kheyboer@pinegov.co.pineallas.fl.us>
Date: Wed, 19 Apr 1995 09:31:09 +0100 (EDT)
To: "aprssig@tapr.org" <aprssig@tapr.org>
Cc: ROBERTST@BENNING-EMH1.ARMY.MIL
Message-ID: <Pine.SUN.3.91.950419092029.23855A-100000@pinegov>
Rendered body type: text/plain

The method of transmitting the text bulletins was actually quite simple but did require some government assistance.

The local Emergency Operations Center has an incoming AFOS (weather wire) line which is split to three printer ports. The data is in pure ASCII format at 9600 bps.

We took an old PC-AT and connected the printer output to one serial port. Using Mirror III (a CrossTalk clone), we buffer the printer output in the AT, then send it, line by line, out a second serial port to a dedicated TNC. The TNC sends the line by line data out with a 2 second pause between packets. These lines appear as unproto beacon packets on the APRS screen and are stored in the All Beacons text page.

In order to comply with FCC regulations, only NWS bulletins intended for the public are sent out this way. The software has a built in "choke" that stops any bulletin containing the phrase "For Intragovernmental use only" within the text.

We tried to send the data initially without buffering it...ie direct connection to the TNC, but the TNC would choke on it and lines would be lost because there is no flow control available on the line coming from the AFOS printer.

Our next project is to find a way to transmit data from the automatic weather stations along the intracoastal waterway bridges out to APRS. That may not be as easy.

Good Luck,

de Kevin KD4UYR

311. USGS 1/100K data

313. Kantronics KPC3 firmware info

From: Bob_Fairbairn-C12509@email.mot.com
Date: 19 Apr 95 09:45:45 -0600
To: aprssig@tapr.org
Message-ID: <"Macintosh */PRMD=MOT/ADMD=MOT/C=US/"@MHS>
Rendered body type: text/plain

I use a KPC-3 for APRS and Kantronics has some new firmware. I order it, hope to find out more. The following is an excerpt from the fax they sent me:

Global Positioning System (GPS) Capabilities New in version 6.0

The KPC-3 offers the most flexible GPS operations available in a TNC, so users can configure and make use of GPS data exactly the way they like. The KPC-3 can connect to GPS receivers with a NMEA-0183 interface and is APRS compatible.

The KPC-3's unique GPS capabilities include multiple string parsing, where users may select as many as 4 of the GPS unit's NMEA data strings. Once the data strings are specified, the KPC-3 continually stores the text in separate buffers. Users can specify which of the 4 buffers should be transmitted and can specify the beacon start time as well as the amount of time between beacons for each of the buffers. This allows multiple stations to easily report without data collision. And since the KPC-3's clock is regularly updated by the satellite-determined GPS clock the transmission times and intervals are always accurate.

In addition, users can set up a tracking buffer to store GPS data for later retrieval. This buffer is accessible via the KPC-3's mailbox. The sysop may also reconfigure the GPS unit remotely by connecting to the KPC-3 and simply changing the parameters.

I have no affiliation with Kantronics, I just use there products! And almost every other major HAM toy maker.

Yep, but they're almost 20 years old in this part of the country. That's why I went to USGS.

I think I may have to do some fortranhacking and do a conv100 type program to do maps from standard format. Of course, I'm also asking TxDOT to recast in OPTIONAL form for me this time. If they can!

I think you missed something in the announcement, The MacMapMaker WILL have the ability to input a GPS file, created by using either MacAPRS or your favorite terminal program and your GPS. MacMapMaker will take the DATA file and use it to create the map data. MacMapMaker will NOT have serial capabilities, so the file will have to come from another program...

Yes, removing this stuff DID reduce the program size, but only by about 100K.

All of the ram requirements for making maps was ONLY used if you actually did that..

Go for it. We here in Northern Virginia are using the KPC-3's with 6.0 and they work great! Best feature by far is the ability to adjust and change the settings of the tnc even while in GPS mode.

I've just set up a second aprs station at my work QTH. There is a digi
that most of us use in the local area (we don't have a WIDE yet) that is
about 2 miles from my new station. I'm currently using an HT with an
indoor antenna. There is nothing I can transmit that will be heard for
1/8 the distance that the digi covers. There is no reason for me to digi
as RELAY (and besides when I transmit my computer screen turns a
different color!)

The REALLY neat thing is the ability to change settings while in GPS mode
using the remote sysop functions. Makes reprogramming trackers while
they are on top of a moving vehicle a snap.

Hello Keith, Bob and all
I will be at Dayton (easy to find, The Atlantic Ham Radio booth 588,
near Yaesu). Not sure if I am going to run mobile, but on VHF, what
frequency should I be using (not our 144.390 Canadian, North Western
NY freq, I assume).

Hope to see some of you there...cheers...mike (va3mw)

321. 6.8a & raw GLL

From: largriff@onramp.net (Larry Griffin, AB5GE)
Date: Thu, 20 Apr 1995 07:31:39 -0500
To: aprssig@tapr.org
Message-ID: <199504201231.HAA08975@ns.onramp.net>
Rendered body type: text/plain

Since installing 6.8a I no longer get reliable posits from raw GLL data. Sometimes it works, but other times the posit shows all zero values even though the View Screen shows valid GLL data.

I prefer to beacon GLL strings from the mobile because it produces less clutter on the map. The actual posit as shown with dead reckoning is not as easy to discern. Besides, you get a better idea of the general direction of movement from a station's track than from transitory vectors.

APR REPLY: THE APRS FREQ IN DAYTON WILL BE 145.79. THERE WILL BE WIDE digipeaters through Columbus and in the Dayton area, I donno about approaches from the North, Southe and West. Last year there were a total of 18 mobiles detected in Dayton. I suspect we will see a lot more this year.

Once we all get in the area, and watch the network. If it is REALY BUSY, then lets back-off on our REP-RATES. I will proably approach with WIDE,WIDE and a rep rate of 1 minute. Once I get to within the last 64 miles, I will back off to 2 minutes, and in the area, may drop to 5 minutes. If we fill up the P list, then anything shorter than 5 minutes will be saturation.

I have a Motorola GPS and a Kantronics KPC-3 TNC hooked up in my car. The \$GPGGA and \$GPRMC data is being received by APRS at my house, but the position is not being plotted on the map.

Could someone with a similar setup please e-mail me a capture file containing the mobile KPC-3's setup as well as data from the mobile tnc (so I can see the proper format). I looked at the HST files but they don't contain any NMEA strings.

Thanks.

APRS is quite new to the Rochester NY area and a few of us are trying our best to work with it and promote it in this area. We usually meet one night a week on the air to practice on VHF and find that some stations QTH Symbol never appears or can take over a half hour to appear on the receivers maps. However, the sender has installed and sees the symbol on his map. His beacon messages come through and it is possible to send and receive messages from the Symbol-less station using either the S command

or from the blue screen. I also find that when using the S command, some stations rapidly get an ACK from me but I never get any ACK from them.

Any clues anyone can give me on these two conditions would be appreciated so I can pass the info along to our group of APRS newcomers.

On Wed, 19 April, 1995 APR wrote

□ APR REPLY: The fact that all APRS stations have the ALIAS of RELAY, does
□ not, and should not add any QRM to the channel (in general).

I agree this should not create any QRM "in general", unfortunately there are
some who believe that "more is better".

□ Are you sure you are not confusing UNPROTO of RELAY with ALIAS of RELAY?

Yes I do know the difference between UNPROTO and ALIAS, that is why I asked
my question.

□ Stations should be sure to change their UNPROTO from RELAY to specific
□ digipeaters, and should avoid using the UNPROTO path of RELAY..

This is why I want to change my ALIAS, we are back the the "more is better"
operating mode. There are those who do not/will not read your README files,
specifically "DIGI.TXT", and those who believe that by leaving/adding RELAY
in their UNPROTO path will get better coverage.(ie:
DIGI,DIGI,WIDE,WIDE,RELAY)
(I've seen as many as 10 returns from just one POSIT) Most operators respond
favorably
to coaching by the local APRS community, and there are others who "do not"
and/or "don't care".

□ I dont see any reason to change your ALIAS from RELAY. Am I missing
something?

It is because of the "do not's" and "don't cares" that I sometimes change MYA
to something
other than RELAY. I know that by changing my ALIAS isn't going to change the
QRM by much,
but I do believe that every little bit helps. The problems discribed are not
continous, some do, after
a while, respond to coaching (or maybe devine intervention, hi), and some
sign off never to be heard
from again, it is during those times when listening does not appear to be a
consideration, that I change
MYA.

If there is a way to change the CFIG file to automatically change MYA when
starting up the
program, I would like to know it, if not I will continue to do it manually.

Thank you for your reply,
it appears that I wasn't specific enough in my original message, I'll try to
be more thorough in
the future.

TNX again,

Rendered body type: text/plain

From: billwb6lpg@aol.com
To: aprssig@tapr.org

Hi All APRSsig readers, & Bob/WB4APR

The MFJ Jewel has arrived finally, 18 weeks delivery, but still missing
(on B/O) the AC plug-in 2amp pwr supply. Hi.. Nice little 5 x 5 x 1-1/2H
package, single square circuit board with separate ICM Xmit & Rcv HC-25U
or FM-2 small xtals. Two crystal suppliers mentioned Jan & ICM, mine had
ICM xtals, the package rattled, so found the Rcvr crystal not installed
and floating around inside on the circuit board. Hi..

Fourteen page instruction manual. Uses a U1 monolithic dual-conversion
narrowband-FM receiver IC that provides all mixer, IF amplification,
limiting and audio functions. Motorola.

Transmitter is Monolithic FM-transmitter IC U2. Freq by 18MHz crystal
and both 1200/9600 baud, by manually changing 2 little jumper plugs.
Power supply operates from 13.8vDC @ 1Amp.

U1 Rcvr Chip is Motorola: MC13135P QWH9428
U2 Xmtr Chip is Motorola: MC2833P KAA9430

Claim of 4-5 watts from Transistor PA stage Class-C amplifier.
Info on minor tuning adjustments, no swr protections, will have to use for
a while @ 1200b, no 96b TNC as yet. One page of 9600 baud operations info, in

manual, will see if another piece of MFJ junk. Hi..

Furnished crystal information (145.010), with Transmitter formula in error.
Usual small HC-25U or FM-2 type, with Rcvr 44-MHz 3rd overtone, and Xmtr
18-MHz Fundamental.

No complete schematic of circuit, only 2 block diagram component
illustrations.

Two power supply cables, and one 5pin din radio cable included. Minor
adjustments advised for Deviation, (no internal deviations control), adjust
your TNC, Crystal oscillator calibration and good cable wiring diagrams
Xmtr/to/TNC, usual 4 wire Mic.Audio, Ground, PTT< Rec.Audio, no receiver
speaker. Front panel bright aluminum, with Power push button and green/power,

red/transmit lights. Heavy black brushed aluminum cover panel over single
circuit board layout.

So far only smoke tested, with 12v DC applied. No on air reports as yet.

Anyways be advised, they are being deliverd, but how long you hafta wait,
knowing MFJ, who knows. And their little plug in transformer, 39.95 power
supply is on B/O, (back order, not body odor.)

73's & Enjoy, Bill/WB6LPG & KA6EYH.#NOCAL.CA.USA.NOAM or
billwb6lpg@aol.com

DISCLAIMER:

Oh yes, I have no pecuniary or monetary interest in MFJ Corp. this is
personal info for readers and Amateurs interested in the above discription
of a product. I in no way reap any benefits from the above.

APR REPLY: Maybe he has not placed himself on his OWN map yet. No
posits are transmitted until the station puts himself on his map.

> His beacon messages come through and it is possible to send and
> receive messages from the Symbol-less station using either the S command
> or from the blue screen. I also find that when using the S command, some
> stations rapidly get an ACK from me but I never get any ACK from them.
APR REPLY: They clearly CANT hear you.

THE PROBLEM IS PROBABLY RELAY-ITIS: stn-B

stn-A

stn-C

stn-D

If everyone is still using RELAY as a path, then A will never hear C and
C will never hear A. Also D and B will only see direct packets. This is
because EVERY packet sent by A is RELAYED by both B and D so that C
always hears COLLISIONS! These collisions occur all over the place.

CONCLUSION: Once you have more than 3 stations, YOU MUST BEGIN TO CHOOSE
your UNPROTO path to use specific calls NOT RELAY!!!!!!!!!!!!!!

This problem also exists with WIDES! If B and D are both WIDES, then
A and C cannot (I say again) CANNOT communicate via WIDE! Use the digi
callsign and you will be amazed how much better your network works!

328. [APRSSIG:878] 6.8a & raw GLL

LG>Since installing 6.8a I no longer get reliable posits from raw GLL data.
LG>Sometimes it works, but other times the posit shows all zero values even
LG>though the View Screen shows valid GLL data.

BB>I assume that your GPS is outputting MORE than just the GLL? Or are you
BB>saying that that is the only one of the threee GGA,GLL,RMC that APRS uses.
BB>If you are outputting only GLL of the three and you are reporting that it
BB>does not work all the time. Then, tell me more details...

No, my mobile outputs GLL data ONLY. I use a Motorola PVT6 GPS with a
Kantronics KPC-3 in standalone mode.
At home... I've been running APRS since version 4.3. I never had a problem
decoding raw GLL data until I upgraded to 6.8a. Now 6.8a occasionally gets
confused and places my mobile's posit at /0000.00N/00000.00W/000/000 even
though the View Mode shows that the mobile is sending out valid data (no, I'm
nowhere near the Gulf of Guinea, HI). When this happens, it continues until I
exit and restart APRS. Then it usually starts working fine!
I haven't tried 6.8a with any other formats besides GLL. I tend to prefer GLL
over GGA or RMC for ground based mobiles. GLL is the shortest NMEA string and
creates the least clutter on the map. I don't care for the velocity vectors,
but that is just my personal preference.

331. Help w/Motorola Card

From: edwardwr@interaccess.com (Edward W Rogers)
Date: Sun, 21 May 1995 08:05:27 -0500
To: aprssig@tapr.org
Message-ID: <199504211303.IAA03410@home.interaccess.com>
Rendered body type: text/plain

Hi Bob , Keith and all,

Ive come across several Motorola GPS cards that I'm trying to interface with APRS. The cards are part of the CoveragePLUS Mobile packages that Motorola put out several years ago. They apparently "talk" via RS232 seial data pcall at 1-8-1-1200B-N and output the data in the following format;

*****N*****WCCSSS#

*****N=Lat
*****W=Long
CCC=Direction
SSS=Speed
#=Signal Quality

the card has a standard Motorola 10 pin connector and my limited documentation indicates that the wiring data is standard for Motorola.

Ive attempted to set them up for APRS using both MAC and DOS Basic programs with out any luck. Any one have an idea or know anything about them? If we can get them on line and running they would make great mobile units, they are mounted in a metal case that appears to be quite solid.

Looking forward to Dayton

332. APRS to Heath WxStn

From: jeff.brenton@espi.com
Date: Fri, 21 Apr 95 11:43:39 -0500
To: aprssig@tapr.org
Message-ID: <9504211143.0GH3501@espi.com>
Rendered body type: text/plain

Actually, there are two questions here. First, if you're interested in interfacing APRS to the Heath weather stations, Bob, I can supply you with the information to do it. I'm currently fine-tuning a Crosstalk Mk.4 script to download observations from the weather station every 5 minutes, post them on a computer network, then broadcast APRS-compatible observations. Unfortunately, I

don't have an extra radio and TNC to put on 145.79 yet...

Second, is the post-6.4 version of APRS capable of having the port address and IRQ specified for COM ports yet? Under OS/2, I've got 5 COM ports, but only COM1 and COM2 have "standard" IRQs... the other 3 use different IRQs, and one "odd" port, to avoid conflicts. I also have another system that uses 16 ports, all at "odd" addresses. If APRS can accept "weird" combinations, I can set it up as one task under OS/2, and still have access to other things that currently use the "standard" ports...

BTW - what's the FTP address for getting the latest version? The only one I've found so far is the 6.4b version posted on CompuServe...

Thanks!

Message-ID: <9504211834.AA23399@aztec.asu.edu>
Rendered body type: text/plain

Bob,

Thanks for the comments on HF dead reckoning. I finally got it to work reliably. My problem was not the wrong use of zulu times, but was due to lack of patience while waiting for the Hf DEAD RECKONING to start working. I find that it takes quite a bit longer for the HF mode DR to start than on VHF, probably due to the change in timing parameters and or selection of the SPEED prompt entry. Anyway all is functioning as advertised, (vers 6.8a) Thanks again.

73, George - W8FWF

334. General APRS comments/?'s

From: jeff.brenton@espi.com
Date: Fri, 21 Apr 95 14:25:29 -0500
To: APRSSIG@TAPR.ORG
Message-ID: <9504211425.0K9IE05@espi.com>
Rendered body type: text/plain

Spending some time reading through the APRS README directory today. Decided to collect thoughts and post them for everyone to comment and/or answer.

TELEMETRY.TXT talks about using the Micro.Interface.Module for telemetry; has there been any thought to implementing one as a transmit-only TNC for attachment to the Ultimeter II? One of our projects for MCESDA is to get a remote weather station set up in each township in the county, which would ONLY beacon the weather. We're even looking at putting all of them on a separate frequency from "normal" APRS, and just repeat their information on APRS after collection at the central site. The MIM would SIGNIFICANTLY reduce the complexity and cost of this, unless it is outrageously priced... no price is mentioned in the file.

The HSP circuit in GPS.TXT is neat - I'm going to try to get one put together for a trip to California next week, where I will be showing off some aviation moving map stuff, and the APRS stuff might be of interest to the group, too... With 12 hours in flight enroute to play with it... It will hopefully be compatible with using two computers to monitor the output of the GPS, since the aviation moving map will also be listening (it runs on HP palmtops).

Have you thought about a format for integrating winds aloft into this system? For example, as a pilot, I'd love to have a station uploading the winds aloft for the local area every half hour or so (forecasts change every 12 hours, but can be amended), and I can give real-time wind/temperature reports. Winds Aloft (FD) are given in a fixed format, with temps included, at 3000 foot intervals.

Coincident with the trip to CA, I see how to embed symbols like VORs in specific maps, but... what's the best way to load a database of VORs that will show up on any map viewed, just like they were "stations heard"? Just use a "generic callsign" in a .BK-format file, and load that?

That's all for now - I'll be monitoring the wire. Thanks!

Rendered body type: text/plain

Just got done killing another month of nights and weekends and polished off OHMAPS03.ZIP. The file is now up to 89 Ohio maps. One can now travel from Cleveland down to Cincy, then up to Toledo, on a 4 mile range. (Except for a small patch NE of Columbus).

These maps include the work of KG8GE & KB8DP in the Marion area, as well as WB4APR's OHBooth.Map (he for got to mark the restrooms in Hara).

The file is available from my LLBBS (see phone number below) as well as ARN BBS in Md. (If I can get on to upload tonight - Fri.)

Hope to see ya all at Dayton - I'll be easy to spot - ye middle aged guy with a pot gut, glasses, my call sign on my hat and a handhlded on my belt. Can't be to many people fitting that discription there ;-)

Could someone send me some information on how to put APRS position information into the BTEXT of BBSSs, NODES, etc.? I thought I had something, but I cannot find it. I did not find it reading through the README files. There was a portion that said it could be done, but not what the different 'codes' are for signifying what kind of station it is. Also, the README implies that the !xxxxN/xxxxW can go _anywhere_ in the BTEXT, but so far it only seems to work if it goes at the beginning. Can APRS pick up grid square data if it is enclosed in [square brackets] _anywhere_ in the BTEXT?

-Greg

Has anyone out there used Autocad for making maps, and then used the conversion software by Jim Krist {KG8GE} I'm interested in going that way but would like to

hear from someone that has used it. I know the software will just do the conversion i believe, if this is the case will any version of autocad work?. I haven't seen the Author on the Sig. Any help will be appreciated.

I got your packet note about co-ordination and the national APRS frequency. Bob W76FRI is no longer the 440 co-ordinator but is still involved in 1296Mhz. We've been on 440.925+ for about 18 months with almost no interference. The only thing we've ever heard is one of the southern Calif repeater outputs on our input when the skip was in last summer. The application has been in the works for several months now.

Last I heard, NARCC does NOT do packet frequencies and leaves that to NCPA. Incidentally, George K6TAM is on the NCPA board.

I like the idea of a national APRS frequency. However, there are LOTS of VHF simplex frequencies available. While I don't like the way the DX packet clutter grabbed a freq, they were at least willing to move around and did so 3 times.

The use of a single national aprs frequency is going to get abused. Already, we have users in the bay area running keyboard-to-keyboard chat session during commute hours, mobiles beaconing their location every 30 seconds, and stations using a digi path of relay,wide,relay,wide,wide,wide. (I really saw this one go by). Every beacon has 6 duplicates.

I'm not too good with the packet politics and will leave that to those that enjoy that kind of bickering. The last time we fired up the ELINT system overlooking the SF/Monterey bay area, the VHF (144-148) showed .05% utilization and UHF (440-450) showed .01% utilization over a 72 hr period. This was about a year ago and is probably higher today. Typical utilization in the commercial and public safety region 150-175 VHF region runs about 5%. I forgot what the UHF region reported. The ham bands are literally empty.

Midnight visitors in the office. The price of being a computer geek. Groan...

340. Kam Plus & APRS

From: BillWB6LPG@aol.com
Date: Sat, 22 Apr 1995 11:54:38 -0400
To: aprssig@tapr.org
Message-ID: <950422115438_92284111@aol.com>
Rendered body type: text/plain
Subj: Kam Plus & APRS
Date: 95-04-22 12:45gmt

From: billwb6lpg@aol.com
To: aprssig@tapr.org

APRS user Bill/KB6LFM & outstanding Commtruck "RADIO FLYER" utilizes GPS/APRS however unable transmit HF from APRS commands while in the program, using his Kam Plus., with Ver6.5 and up now V6.8a. All same/same as below.
Setup as fol: MYG - GATE

STR - \$7E/\$7C ((~/|))
PORT - VHF..... (To force HF xmit- changed to HF)
S - FREE BYTES 2943 A/H stream - IO DISCONNECTED

Boots-up APRS , all normal and in VHF mode. Changes Unproto path to "GATE, WIDE/APRS VIA Digil. Types C-H (Controls -HF) and 2nd XMIT line at bottom goes from VHF to HF , however Kam+ will only transmit on VHF side, anything sent from his keyboard. A GPS mobile with GATE in path is correctly GATED from VHF to HF by his Kam+. Yet from his keyboard he cannot transmitt on his HF side.

Retyping C-V (Controls-VHF) the 2nd bottom XMT line shifts window from HF to VHF and keyboard transmits normally on VHF side, as it should. Unproto path not changed, and no VHF WARNING BOX (Gate in VHF path) is displayed. VHF side uses Digil path as is normal for VHF side.

By changing PORT to HF and using ~A and |A can lock into sending on HF side only, won't go to send on VHF side, yet GATES HF to VHF..

Anybody any ideas... ?????? Have done RESET, but no help. Intend do complete (open Kam box) and due RESTORE command.

I have found using some other programs in computer changes paramaters of Kam, this possible clue but cannot pin-point which one is causing above, contrar to APRS use.

Has numerous other fancy programs in computer, including PC Tools, Dos V5.0...

Anybody have any clues, ideas , thoughts, suggestions. Only saw one other msg from 9 area user with same problem. ????

My home QTH Kam+, set up as above, no such problem, Go HF xmit on keyboard command C-H and back to VHF with C-V command. No Unproto path change, only still get large WARNING box on VHF side, unless change the VHF Unproto path. APR/Bob to fix he says.

73's and Thanks for any help suggestions. Bill/KB6LFM @ W6PW.#NOCAL.CA. USA.NOAM..

73'S & Enjoy, billwb6lpg@aol.com or @KA6EYH.#NOCAL.CA.USA.NOAM.

I don't know how many of you all can retrieve files that are attached to these messages. If you can, then the attached file is basically a 1.5 mile range street map of the are around Hara from the 1:100,000 CD-ROM , combined with the booth map by WB4APR.

How accurate is it ? - Well, how accurate are most GPS's with S/A cranked up. I would not use it to find the restrooms in the dark, but, hey, it gives yu an idea of how much detail one can get on maps.

Message-ID: <2968@paccomm.com>
Rendered body type: text/plain

Seems like Wx info is still the burning topic in APRS.

Jeff Brenton raised the issue of winds aloft.

Seems like the 3D display I asked Bob to do for gliding would be ideal for this. The subject of the Doppler radar stuff seems to have gone quiet..... Anybody getting info to Bob on this?

The local Pinellas county gurus sed they have NWS data coming out on the local system. Much as I've stared at the APRS monitoring stn here I haven't seen any of it yet (?????????).

I'm sure Bob and I will be rubbing shoulders and comparing new ideas next weekend. Any other thoughts, please send them to me or Bob.... Putting the ULTIMETER-II with the single chip telemetry module would be neat, but not practical on an existing APRS channel (no DCD of data is done, so it would QRM stuff something rotten). PacComm has some other stuff up it's sleeves in this regard, so stay tuned..... Anyone got any idea what frequency the ICW wx stations are on????? These are on every swing bridge up and down the ICW. Monitoring these on a separate receiver and converting to APRS format would be very useful..... Best Regards, Paul

Re: Weather data on APRS

Paul, don't strain your eyes. The RACES radio room is being rebuilt at the EOC and the WX data source is temporarily disconnected. When it was up, it was not being digipeated.

However, we had a meeting today with the Skywarn people from Pinellas, Hillsborough and Manatee County today. I have been advised the AFOS feed will be established prior to the start of hurricane season, and Manatee County will be donating a VHF radio and a TNC to establish a full time APRS station at the NWS Office in Ruskin.

Re: Doppler Radar pictures

Actually, I hadn't touched on that yet because the WSR-88D at Ruskin has not yet been commissioned. It will be commissioned on April 29, 1995, at which time the FAA will attach its feed line and the KTBW hourly radar summaries will return to public access via DUATS, Compuserve, Internet, etc.

Since the FAA/NWS use a grid system for composite radar data, I think it would be a great idea.

PS...Once KTBW is on the air, we hope Manatee, Sarasota, Pasco, and Polk Counties will join us on APRS. Current plans include moving the WIDE on

the Clearwater Courthouse to the top of Majestic Towers in South Pasadena..
That would be 225 ft up.

73 de KD4UYR.

I rcvcd the following critique abt the use of APRS.

>Bill, I guess I can't understand how a "BEACON" of information sending thru
>digis or nodes are going to work. You will not have any idea whether any
>station received the information or not as there is no acknowledgements.
>However, if you set up a BBS to forward the info into the ESDA coordinators
>personal mailboxes, you would know that they were received. Dont send
>the info to any BBSs, just forward it directly to the ESDA people.
>You are sold on APRS but trying to start another network strictly dedicated to
>APRS is not what most folks are interested in, they still are trying to build
>the backbone up. Down this way, the preferred type of operation would be
>to take all forwarding off of 5.01 not start up another network of APRS
>stations. All of this for the one bad month a year of weather, doesn't make
>sense to me. The NWS can come right down the backbone, connect directly to
>nodes and right into the ESDA coordinator's mailboxes and leave the info,
>not hope that there stations see the beacon of information that would not
>be ack'ed back.
>I will see if anyone is interested in attending on the 30th
>but it sounds like there will be NO discussion on what's the best, it sounds
>like it has already been decided.

You know, your first message to me about
this APRS and 5.79 was just last week, up until then NO one had discussed
this with ANY downstate ESDA coordinators in Hancock or Warren county, now
all of a sudden it is said we not only need nodes, but they have to be on
5.79...Lots of equipment on 5.79 just for the weather? HMMMMMMMMMM.
73 Frank

The guy has some valid points that need to be addressed!!!!

Any ideas?

To: aprssig@tapr.org
Message-ID: <9504230043.010JS01@espi.com>
Rendered body type: text/plain

On 22 April, Paul Evans mentioned that the MIM circuit doesn't do DCD, and
would cause QRM. Hmm... the doc file said that it had a line that could or
should be attached to the receiver, to detect when the frequency was busy;
not as good as a true DCD from a modem, but that is how a lot of simple TNCs
seem to work. Anything heard means "frequency busy, keep quiet".

While I like the PacComm solution, for the situation I'm talking about, it's
vastly overkill. As I mentioned, we're looking into putting our "network" of
such automated stations onto a separate frequency, probably commercial or
public service band, because there is some information we want to collect
that isn't exactly for public consumption - namely, water levels at all our
flood gauges.

[That particular application, BTW, would probably involve a computer at the
site to take the gauge readings, so having a full TNC makes sense there]

I was introduced to APRS strictly because of its weather aspect. In fact, it
wasn't until I started reading the documentation that I discovered that
wasn't the primary purpose it was designed for... Or, was it?

348. PROB Ver. 6.8/6.8a

From: Joseph Hussey <jhussey@freenet.columbus.oh.us>
Date: Sun, 23 Apr 1995 08:08:22 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.3.07.9504230822.A28377-a100000@acme>
Rendered body type: text/plain

Have noted the following problems with ver 6.8/6.8a.

1. DXcluster Mode works intermittently. On 6.8 I could not get it to work at all and on 6.8a it worked one time (I have cannot get it to work again!!). Data is received but calls are not placed on the map. The P-screen shows all lat/long as nulls (000s). The alt-ALL command will plot the entire callsign database.

2. One user reported an intermittent problem, starting with Ver. 6.8a, with the software failing to position GLL tracks. This problem was observed on version 6.8 - where the GLL string would be received and displayed at the bottom of the screen but not placed on the screen (e.g, POS 2220117>/RAW - would appear in the blue box). The GGA and RMC sentences seem to track OK. This might relate to what was reported on Ver. 6.8a.

349. Advice on Garmin GPS-40

Message-ID: <9504231407.AA08296@ InterServ.Com>
Rendered body type: text/plain

Hi fellow SIGgers:

I am considering buying a Garmin GPS-40 not only for APRS use but also for hunting and fishing.

Has anyone used this unit for these multiple uses and what is your opinion?

I notice that the unit does not have a "pop-up" type antenna but you must buy separate antenna. How does the unit work without an antenna added. Is it ok in the woods as well as out in the open? Is the accuracy of the "fix" effected by having an outside antenna attached?

Any opinions would be appreciated. You may e-mail me direct if you don't wish your opinions to be broadcast by the SIG.

Thanks for your help. 73.

Rendered body type: text/plain

Re: Bill's message on the criticism he is getting for APRS and SKYWARN use

When I saw your message, I almost fell out of my chair laughing. The argument you are getting is IDENTICAL to the one we went through over a year ago when I first suggested scrapping the old message forwarding system for something new...even the frequency is the SAME!

Anyway...try these replies against their arguments and you may very well get them to see the light:

1. APRS sends bulletins in real time direct to the user, sounding a tone at the same time....one packet burst is received by all... less channel loading.
2. APRS allows for real time dead reckoning of all severe storms and tornados as displayed on local NWS radar or based upon NWS forecast data. Also has capabilities of ranging, tracking, or identifying storm shelters, evacuation zones, and supply depots, traffic posts, you name it, you can track it!
3. APRS allows for the graphical identification of all storm spotters and their locations....When asked for conditions at a specific location, the net control operator can look at the map and know who to call on the radio.
4. APRS can graphically display watch boxes and warning boxes.
5. APRS can monitor as many automatic weather stations as you want to install, and alarms can be set to automatically alert ALL of the monitoring stations, AT THE SAME TIME.
6. APRS messages ARE acknowledged....the ACK packet is sent from the receiving station regardless of weather the operator is at the keyboard.
7. APRS system can be monitored by non-hams at NWS and EOC offices. Any scanner can be used as a receiver.
8. APRS can be set up with an AUTOMATIC HF GATEway for nationwide coverage.
9. Nothing in APRS stops you from having a VHF-VHF node on the frequency to connect into the existing BBS system.
10. Nothing in APRS stops you from doing a connect or having a personal mailbox on the frequency.
11. NWS bulletins can be fed directly onto the APRS frequency and displayed via the All Beacons screen. The National Hurricane Center will be doing this beginning this coming season... If that works, perhaps SELS will consider the same.
12. The only special equipment required for APRS to work at its full potential is an IBM PC or MacIntosh computer to run the program, everything else is the same.
13. Non IBM/MacIntosh users can still read the bulletins in Unproto monitoring mode and they can still address stations using the KA0BCD : Message mode in unproto.
14. One, well placed, high altitude digipeater is all you really need.
15. The 145.79 frequency is being pushed nationwide since it is NOT cluttered with other packet traffic. Use of an existing packet net for emergency communications does not work. No way to stop hams not involved in the emergency from downloading the last six months of the AMSAT journal while your trying to pass priority traffic!
16. Message forwarding systems do NOT guarantee receipt of the message, they only guarantee the message was received at the first message server. If you don't believe me, send me a packet message to: KD4UYR @W4DPH.#CLW.FL.USA.NA....put in the exact time you sent it... IF I get it....I will reply with the time lag!
17. Use of message servers REQUIRES the recipient to LOOK FOR the message on the BBS or PBBS. APRS messages are there as soon as they are sent.

Thats about all I can think of right now but I am sure there are more reasons to use APRS instead of the conventional store and forward

system.

Good Luck!

Rendered body type: text/plain

Bob, there seems to be a problem with the math used in 6.8a to convert the Metric Altitude numbers to feet. When I check the current read out on the Garman against the screen in APRS 6.8a, APRS reports a lower altitude. I run the Garmin 45 in Simulator mode so I can preset the altitude and other params to what I want. This makes check out easy when you can't get real Sat signals. BTW 6.8a is behaving better with the Garmin-45, but there are still alot of times that APRS reports good GLL reads but nothing is posted to the map. Keep up the good work....

>I am considering buying a Garmin GPS-40 not only for APRS
>use but also for hunting and fishing.
>
>Has anyone used this unit for these multiple uses and what
>is your opinion?

The advantage of the Garmin GPS-45 over the 40 is that the 45 can accept input voltages of 5 to 40 volts DC (GPS-40 has a much narrower range, not even up to 13.8 volts), and that it can accept an external antenna (BNC connector). The power / data connector lists for \$30.

The GPS-45 is waterproof, and the GPS-40 probably is also. Both are very small.

Recently, West Marine had the GPS-45 on sale for the same price as the GPS-40, \$299.99. Sorry, I don't have their phone number.

Both units evidently use the same difficult-to-learn, easy-to-screw-up command set. West Marine is reported to sell a third-party book on how to program the unit(s).

Good luck!

aprssig@tapr.org

With most all LapTop computers now offering PCMCIA card slots and only one serial port, has anyone considered adapting APRS for use with any type of PCMCIA card.

Know Trimble has a Mobile GPS PCMCIA GPS Sensor and mailing you their brochure on the sensor. Mentions GPS Demo Program and expensive Developer's Software Toolkit. (\$995.00).

>From Tigersoftware catalog mentions operates with City Streets for Windows in a laptop with the Trimble PCMCIA card.

With the gathering of intellectuals at Dayton, APRS/PCMCIA use's should be considered for future expansion.

I wrote to Trimble on subject on April 1, but no reply as yet.

Now that Dayton is upon us, enlighten all on the mystery Readme.DIR file VOXRPTX.TXT .. What's this tone encoded GPS APRS MIC Encoder all about that us non Dayton attendees have so anxiously been awaiting. Little more pre info desired. Hi...Have fun at Dayton...

The MAC version of APRS, (MacAPRS) has supported PCMCIA GPS units since the PowerBook 500 series PCMCIA adapter came out.. There are two major PCMCIA GPS units out there, Magellen, and Rockwell. Rockwell makes two versions, one is NMEA (this is the newer unit) and the other is Rockwell Binary. I support both types (the NMEA and the BINARY).

If the Interrupts are changeable, the NMEA GPS should be usable on a PC laptop WITHOUT any change from Bob, since these units just act as serial port devices.

TAPR Activities at Dayton '95

Dayton is almost upon us and here is the list of TAPR activities and events happening during Dayton. We hope to see lots of folks around and please stop by the TAPR booth and say hi!

TAPR Booth

The booth is located at the same location as the last several years. We should have most items and kits available and another big membership offer will be available to new members! Come by and say hi to the TAPR gang and if you want, help out behind the table. The more the merrier.

Regional Groups Note: If you are with a regional digital group, please stop by and chat with Greg Jones, WD5IVD about how TAPR can do things with your regional group. There will also be a place at the booth to place regional materials, so if you have something to hand out, drop it off.

Friday - TAPR Digital Forum

1:00pm - 1:45pm	Introduction to Digital Communications Greg Jones, WD5IVD
1:45pm - 2:00pm	TAPR Update John Ackerman, AG9V
2:00pm - 2:30pm	Layer 1 and Radio Issues Mel Whitten, K0PFX
2:30pm - 3:00pm	TAPR/AMSAT DSP-93 Project Update Bill Reed, WD0ETZ
3:00pm - 3:30pm	TCP/IP Issues and Trends Barry McLaren, VE3JF
3:30pm - 3:45pm	BBS Issues and Trends Barry Buelow, WA0RJT
3:45pm - 4:00pm	HF Digital Communications Trends
4:00pm - 4:30pm	APRS Bob Bruninga, WB4APR
4:30pm - 5:30pm	TAPR APRS SIG Keith Sproul, WU2Z

PACK*BASH T95 - Friday Evening

A new event for the digitally-inclined ham, featuring:

- * Buffet dinner (with cash bar)
- * Nationally-known speakers holding forth on current topics:
 - * Bob Bruninga, WB4APR (Author of APRS)
 - * Dewayne Hendricks, WA8DZP
- * Prize raffle
- * Lots of Informal Discussion
- * TAPR NET SIG and a second APRS SIG meeting

When?

Friday evening, April 28, 1995
Dinner starts at 7:00 PM, speaker at 7:45 PM
Everyone is invited to attend, but dinner is only available to those with reservations.

Where?

TJ's Restaurant, 2462 Dryden Road, Dayton
(Dryden Road exit, I75 -- across from the Holiday Inn)
(Maps available at the TAPR booth)

How?

Dinner requires advance registration (by April 24th)
Come by the TAPR booth at Dayton to check on additional space.
Everyone is invited to come, but dinner is only available to those with reservations.
Dinner cost is \$16.00 per person, tax and tip included.

To register, contact:

TAPR (tapr@tapr.org)
Phone: (817) 383-0000, Fax: (817) 566-2544

Who?

PACK*BASH is co-sponsored by TAPR -- Tucson Amateur Packet Radio, the national leader in digital communication -- and the Miami

Valley FM Association, Dayton's packet radio club.

(This is a replacement of the McNasty's event)

Saturday - BBS SIG Meeting

The TAPR BBS SIG will meet Saturday night at 7:00pm

Where: Radison Hotel - Premier Room
The Radison is located near the intersection of I-75 and
Needmore Rd. This is not far from Hara Arena.

New feature this year - CHAIRS !!!

This is a great opportunity to meet with fellow BBS Sysops and discuss
current events and plans for the future. TAPR membership is not a
requirement, this event is open to the public.

For more information, stop by the TAPR booth at HARA.

Tucson Amateur Packet Radio (tapr@tapr.org)
8987-309 E Tanque Verde Rd #337 * Tucson, Az * 85749-9399 * 817-383-0000

APR REPLY: Yes! Its a beaut'!. A 5 foot PVC pipe with U-II annmometer on
the top, 19 inches of NICADS, MIM Module an Agrelo XMTR below that and a 19
inch antenna dangling at the bottom. A solar panel on the side completes
the STAND-ALONE WX XMTR! No wire, no power, no nuttin!
>
CAVEAT: It transmits, but not WX data yet. Havent written the unique WX
parsing code yet. It will be on display at Dayton...

> The HSP circuit in GPS.TXT is neat - I'm going to try to get one put
> together for a trip to California next week, where I will be showing off
>
APR REPLY: Be prepared to mess with voltage levels unique to your GPS and
your PC. The HSP schematic I deelped assumed a +5/0 volt NMEA signal.
The GARMINs now are putting out +2/-2 volts and there may not be enough
positive excursion to make the HSP and the PC happy. Look at the data
going into the PC on a scope and be sure you are getting acceptable data
levels. Remove the extra emitter dropping diodes to help...

> Coincident with the trip to CA, I see how to embed symbols like VORs in
> specific maps, but... what's the best way to load a database of VORs that
> will show up on any map viewed, just like they were "stations heard"? Just
> use a "generic callsign" in a .BK-format file, and load that?
>
APR REPLY: Since loading a BK file wipes out wnything else on your
screen, a better way is to make the file a .HST file. Then, anytime you
want to see VORS, simply replay the file. The VORS will appear until you
erase or re-draw the map. But they will not consume P-list space

364. Re: [APRSSIG:905] PROB Ver. 6.8/6.8a

APR REPLY: Hummh, I though all was fixed in 68a? Anyone else?

be removed.

Turns out after analyzing the circuit and talking with PacCom, that my Compaq LIT Lite 25 laptop does not provide a voltage on pin 6. This voltage is "borrowed" to power the HSP circuit. I powered the circuit from pin 6 of the TNC (on a 9 pin port) and it worked great!

Re: UIploading and Downloading:

I use the shareware program GARDOWN4.EXE, by Mike Montgomery to do this. It will use Comm port 1 or 2 on a PC to Download Waypoints, Tracks, and Routes and allows uploading of Waypoints!

It can be gotten from my FTP site at <ftp.mindspring.com/users/~rwf/aprs>

I also have aprs68a there as well as some other files.

See y'all at Dayton. Will be APRS/GPS active on 5.79

DXcluster is now working with Ver 6.8a. I made sure that the APRS directory was in my PATH statement (that did not do it but its a good idea) and then placed the APRS/SYSTEM in an APPEND path in my autoexec.bat file. Apparently this enablaes programs to open data files in specified directories as if these files were in the current directory. This seems to have fixed the problem!!!! I am using MS-DOS Ver 5.0 and run APRS from a "stacker volume" designated drive "D:".

Hope this helps (and I hope it is in fact the cure).

Great map posted by KB8JX0 with streets detail in and around hara arena. WWhen I first tried to load it into MAPFIX, I keep getting an error 5.

Turns out, it didnt like the RANGE of 1.5 miles.

I changed it to 2.2 (so you could see it at the 2 mile range) and it worked fine. Then I changed it back to 1.5 to see why that failed, and it also worked fine! Now, I dont have a copy of the original to see what could ave been worng with the original range....

Anyway, when you get this map, change its name from OHHARA2.map to OHB00THS.map to match the existing entry in the recent MAPLIST.APR distributions. This map supersceedes my original OHbooths.map... and should replace it.

370. APRS on VOICE REPEATERS

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Mon, 24 Apr 1995 21:32:02 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950424212340.29583E-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

Here is the gist of what we will be introducing at DAYTON. Think it through, I think it is the ultimate for HAM RADIO!

VOX-RPTR.txt	INTEGRATING APRS WITH VOICE REPEATERS	APRS
	THE APRS LOCATOR SYSTEM	PROPRIETARY
	Copyright 1993,4,5 WB4APR	

As the mobile GPS phenomenon continues to grow, there is a much more cost effective method to provide mobile vehicle tracking, than to require every mobile to have an additional TNC, digital radio, and second antenna costing over \$400! The mobile position reports should be integrated into the EXISTING vehicle two-way radios by transmitting the position report in a very brief tone burst at the end of a voice transmission. With this scheme, no additional hardware is required in the vehicle, other than a hand-held GPS unit.

By transmitting a position report at the end of a voice transmission, not only is this a period of dead time due to the almost universal courtesy-beeps found on amateur repeaters, but the tone burst can be easily muted out at the repeater receiver, so that the other mobile users DO NOT HEAR it! If the tone burst is about 0.25 seconds, then it will be virtually transparent to voice repeater operation. The new APRSc (Compressed) format achieves a complete position report, course, speed, and digipeater information in about 30 bytes including header, vice the 90 or more bytes in a normal APRS position report.

At the voice repeater receiver, a special APRS REPEATER NODE TNC picks off the position report and digipeats it out onto the dedicated APRS digital frequency for mobile position reporting using a path derived from the bits in the TO-SSID. In addition, it appends the repeater frequency onto the end of the position report so that digital users can see where the packet originated. If all voice repeaters digipeated onto the same digital position reporting channel (usually 145.79 nationwide) then anyone monitoring the APRS frequency will see ALL mobile position reports from ALL GPS mobiles on ALL frequencies!

HARDWARE: To implement this APRS LOCATOR SYSTEM, there are two critical elements needed. First is an APRS MIC ENCODER to handle the integration of the mobile GPS data into the users mobile microphone connector. Second is the specialized APRS REPEATER NODE that handles the digipeating of the compressed position reports heard on the voice repeater inputs over to the

APRS digital channel. Details of each of these designs follows.

APRS MIC ENCODER: In order to make the APRS LOCATOR SYSTEM practical, the packet TNC for injecting the position report into the microphone audio had to meet several design constraints:

- * Must interface to UNMODIFIED radios via the MIC connector
- * Must compress position report into less than 0.25 seconds
- * Must Fail Safe so that MIC can always be used
- * Must be low enough in power so that it does not load the MIC power pin
- * Must have easily selectible user parameters
- * Must be very small for easy mounting and portability
- * Must accept the readily available NMEA output from GPS receivers
- * Must use standard AX.25 for interim compatibility

The result is a 1200 baud position report compressed to 32 bytes including beginning and ending FLAGS. This equates to about 250 ms, including CALLSIGN, DIGIPEATER PATHS, and a minimum message capability, and the packets are still receivable on ANY AX.25 TNC.

PACKAGING: The initial APRS MIC ENCODER design is about the size of a match box. This permits it to be TAPED to the MIC cord for convenient mounting and for easy access to the configuration switches. The circuit interfaces to the MIC connector and has a miniature 1/8 inch phone jack to receive the NMEA data from the GPS unit. Not only is this arrangement the ultimate in simplicity, but it also makes the entire mobile vehicle position reporting system as portable as the microphone! Simply move the MIC from vehicle to vehicle, and as long as the radios are compatible at the MIC connector, then the vehicles are GPS ready!

On the APRS MIC ENCODER, there are 12 user configuration switches to permit the choice of operational mode, APRS symbol, digipeater path, and a brief message indicator as follows:

ON/OFF	Used to disable APRS beeps on non configured voice repeaters
AUTO/OFF	Auto will transmit when repeater is silent more than N secs.
DIG/VOX	Configures for digital channel or voice repeater use
1 Minute	Used to add 1 minute to the standard 30 sec period
2 minute	Used to add 2 minutes to the standard 30 sec period
DIR/OMNI	Used to set Directional or OMNI digipeating paths
LOC/DX	Used to set LOCAL or LONG DISTANCE digipeating paths
N/S	Used to set North/South digipeater directional routing
E/W	Used to set East/West digipeater directional routing
MSG1	Message bit 1 for user defined messages
MSG2	Message bit 2 for user defined messages
MSG3	Message bit 3 for user defined messages

On the back of the encoder module are 4 jumpers for selecting from the 16 different APRS mobile vehicle symbols. In the AUTO mode, after DOUBLE the normal transmission period, AND if the repeater has been silent for at least this same extended period, then a position packet will be transmitted.

DIRECTIONAL DIGIPEATING: Incorporated into this APRS LOCATOR SYSTEM is a new directional digipeating algorithm. Since the standard AX.25 digipeater field is omitted from the APRS compressed format, only a few bits are used to encode digipeating instructions to the APRS REPEATER NODE. These bits indicate whether the position report is to be digipeated omni-directionally or directionally, a short or long distance, and in what direction. This directionality concept is useful for reducing QRM for the long distance traveler that wants to be seen several hops ahead or behind his direction of travel. He sets the bits in the forward direction if he wants to alert those ahead that he is coming, or he sets them in the backward direction if he wants to inform his home area of where he has gone.

OMNIDIRECTIONAL DIGIPEATING: If the mobile has selected OMNI, then his position reports will be radiated outward in all directions. The new FLOOD-N algorithm (described in WIDE-N.txt) describes this function.

APRS REPEATER NODE: This special TNC NODE is designed to be integrated into every standard amateur voice repeater. The TNC performs a number of special functions to fully implement the APRS LOCATOR SYSTEM:

- * It has true DCD to distinguish between voice and data
- * It has a MUTE output (DCD) to mute the repeater audio during position reports which must be 99.9% immune from falsing on voice
- * It digipeats all position reports from the repeater receiver to the

- dedicated APRS digital channel
- * It implements the APRSc Directional Digipeating algorithm
- * It implements the APRS FLOOD-N digipeater algorithm for OMNI packets
- * It appends ADDText (usually the rptr freq) to the end of all packets ("Voice on 146.940")
- * It must have a second DCD audio input for the APRS packet channel for true CSMA efficiency, but this need only be an audio COR detector.

Notice that although the APRS REPEATER NODE function only listens on the voice repeater input and only transmits on the digital APRS packet frequency, it must also have a secondary DCD listening to the APRS packet channel to avoid collisions. This special APRS node function is NOT involved in any further routing on the APRS digital channel (I mean that it does NOT serve as a general purpose APRS digipeater on the digital channel). All it does is to insert the appropriate directional or OMNI digipeater path and digipeat the packet. This distinction, of course, is only a functional distinction, since APRS digipeater functions can be co-located, or even built into the same NODE box as long as dual digital receiver channels are maintained.

PERFECT DCD OR MUTE CONSIDERATIONS:

Since the ultimate acceptance of the POSIT-PACKET on voice repeaters will be determined by the minimization of the BRAAAAAAP sound on the repeater output, the DCD and subsequent muting of the repeater transmitter are very important. The APRS NODE must therefore provide a separate MUTE signal that is 99.99% percent accurate. Since most voice repeaters have simple analog delay lines of up to 50 ms to eliminate the squelch tail, the actual MUTE decision can be made as late as 50 ms after the initial DCD, and still be able to mute the packet from the repeater output!

NOTES: Notice that the APRS REPEATER NODE will also work on the digital channel! In other words, the APRS REPEATER NODE algorithms can also be running simultaneously in all of the APRS DIGI's so that the APRS compressed format will be picked up directly on the digital channel. These original packets are distinguishable because they DO NOT have an original DIGI field. Once a NODE processes them and adds the DIRECTIONAL or WIDE routing, they will be forwarded as usual. Notice that the NODE hardware can actually do both functions as long as dual digital receive channels are provided.

371. APRS FORUM @ DAYTON?

From: Joseph Hussey <jhussey@freenet.columbus.oh.us>
 Date: Tue, 25 Apr 1995 11:25:24 -0400 (EDT)
 To: aprssig@tapr.org
 Message-ID: <Pine.3.07.9504251124.A9606-9100000@acme>
 Rendered body type: text/plain

On one of the local repeaters it was reported:

There will be an APRS forum at Dayton this year. It will be held at the Radison Hotel, 2401 Needmore Rd. (corner of I-75 & Needmore Rd.), Friday morning from 0800 to 0930. It is supposed to be hosted by Gwen Reedy "Jade Room #2".

Can anyone confirm this? I am aware of the APRS "eyeball" Saturday evening at Mallard Landing. This is the first I have heard of the APRS Forum.

> Room #2".
>
> Can anyone confirm this? I am aware of the APRS "eyeball" Saturday
> evening at Mallard Landing. This is the first I have heard of the APRS Forum.
>

They are several APRS related events happening.
I hadn't heard about the one put on by PacComm. Should probably be pretty good and give you a chance to see what products they have available without the press of the HamVention.

The APRS SIG (TAPR) has two presentations/meeting during the TAPR Digital Forum on Friday during HamVention:

4:00pm - 4:30pm APRS
 Bob Bruninga, WB4APR
4:30pm - 5:30pm TAPR APRS SIG
 Keith Sproul, WU2Z

Then on Friday evening, Bob Bruninga, WB4APR (on this SIG) will be discussing I believe some future issues for APRS...in addition Dewayne Hendricks, WA8DZP is going to be discussing PCS and other related technologies...should be two excellent discussions.

Last I heard Keith Sproul will also be holding forth an APRS SIG informal chat after dinner and the speakers. Also, the NETSIG will be meeting. The TAPR BBS SIG is meeting on Saturday.

PACK*BASH '95 - Friday Evening

A new event for the digitally-inclined ham, featuring:
* Buffet dinner (with cash bar)
* Nationally-known speakers holding forth on current topics:
 * Bob Bruninga, WB4APR (Author of APRS)
 * Dewayne Hendricks, WA8DZP
* Prize raffle
* Lots of Informal Discussion
* TAPR NET SIG and a second APRS SIG meeting

When?

Friday evening, April 28, 1995
Dinner starts at 7:00 PM, speaker at 7:45 PM
Everyone is invited to attend, but dinner is only available to those with reservations.

Where?

TJ's Restaurant, 2462 Dryden Road, Dayton
(Dryden Road exit, I75 -- across from the Holiday Inn)
(Maps available at the TAPR booth)

How?

Come by the TAPR booth at Dayton for dinner reservation.
Everyone is invited to come, but dinner is only available to those with reservations.
Dinner cost is \$16.00 per person, tax and tip included.

To register, contact:

TAPR (tapr@tapr.org)
Phone: (817) 383-0000, Fax: (817) 566-2544

Who?

PACK*BASH is co-sponsored by TAPR -- Tucson Amateur Packet Radio,
the national leader in digital communication -- and the Miami
Valley FM Association, Dayton's packet radio club.

(This is a replacement of the McNasty's event)

Saturday - BBS SIG Meeting

The TAPR BBS SIG will meet Saturday night at 7:00pm

Where: Radison Hotel - Premier Room

The Radison is located near the intersection of I-75 and
Needmore Rd. This is not far from Hara Arena.

New feature this year - CHAIRS !!!

This is a great opportunity to meet with fellow BBS Sysops and discuss
current events and plans for the future. TAPR membership is not a
requirement, this event is open to the public.

For more information, stop by the TAPR booth at HARA.

Tucson Amateur Packet Radio (tapr@tapr.org)
8987-309 E Tanque Verde Rd #337 * Tucson, Az * 85749-9399 * 817-383-0000

374. Help ULT II-APRS 68a WX probs

Subject: detailed MAPS from the U.S. Bureau of the Census

I dont recall seeing anyone mention this as yet another source of
maps, but apparently the gov't is providing street level maps for
free; from the web page:

"Welcome to the home page for the TIGER Map Service, a project
sponsored by the U.S. Bureau of the Census. The goal of this service
is to provide a public resource for generating high-quality, detailed
maps of anywhere in the United States, using public geographic data."

Available from <http://tiger.census.gov/>

the maps look pretty good...

RE: Tiger Maps

The program I announced a few days ago, MacMapMaker, will be able to import TIGER data and output this to PC APRS map files..

I already have the TIGER documentation and am already working on this...

Even though this program runs on the Mac, it will benefit the PC people quite a bit because it will be able to create AND edit all of the maps that the APRS people have been wanting..

Thanks for your comments on the Garmin unit.

N3HPR had this same problem here in Erie. The fix was to
bring up APRS without config file and answer all the
initialization questions from the beginning making sure
not to miss the one on the rain gauge. Missing it by
hitting a return apparently will not allow the info to
pass to APRS. Try it and let us know.

>>Bill, I guess I can't understand how a "BEACON" of information sending thru
>>digis or nodes are going to work. You will not have any idea whether any
>>station received the information or not as there is no acknowledgements.
>>However, if you set up a BBS to forward the info into the ESDA coordinators
>>personal mailboxes, you would know that they were received. Dont send
>>the info to any BBSs, just forward it directly to the ESDA people.

One problem you might run into when presenting APRS is that sometimes, terms
are used that many people associate with poor operating practices. Examples
of this are the terms "beaconing" and "digipeating". It probably works best
to think of an APRS network as an "unconnected network", since we've been
conditioned to think of "beacons" as evil and detrimental to a packet
channel. For the most part, no AX.25 connections are ever made in an APRS
net. Position information is sent using a broadcast mode, where every
station's information is updated periodically. The same is true for stations
sending weather information, whether manually entered or sent automatically
from a station equipped with a weather station. Although this information is
not acknowledged, it is updated continually and checking to see when the last
transmission was received is a very simple manner. My own experience is that

this mode of operation is very reliable in areas with sufficient RF coverage.

Messages can be sent from one station to another when it is necessary to communicate with only one station on the net. These messages are automatically acknowledged upon successful receipt at the receiving station, so there is never any doubt as to whether or not the message was delivered. These messages are also sent in an unconnected mode, so APRS can remain active during these communications. I have found these messages to be extremely reliable and fast, and are in fact much easier to send than generating a BBS type message on a PBBS. There is no need to set up a connection to a remote mailbox through a node or nodes. The message gets to its destination a lot faster.

>>You are sold on APRS but trying to start another network strictly dedicated
>>APRS is not what most folks are interested in, they still are trying to bui
>>the backbone up. Down this way, the preferred type of operation would be
>>to take all forwarding off of 5.01 not start up another network of APRS
>>stations. All of this for the one bad month a year of weather, doesn't mak
>>sense to me. The NWS can come right down the backbone, connect directly to
>>nodes and right into the ESDA coordinator's mailboxes and leave the info,
>>not hope that there stations see the beacon of information that would not
>>be ack'ed back.

Using APRS does not preclude the possibility of establishing direct connections and leaving messages in mailboxes. All of that can continue. In addition, the NWS and ESDA users would be able to see real-time map displays with graphic and text representations of weather conditions throughout the area. It adds value to what they are currently doing (or want to do).

APRS has a lot of public service applications that go way beyond weather reporting. My area has a mature network and good WIDE digipeater structure, and it is possible to see many stations on the map on any given day. There are a number of public service events that occur here where APRS is used to track the position of vital assets during the events.

APRS "sells itself" when you demo it in an area that has a mature network and at least one good digipeater. You might want to explore the possibility of getting a WIDE digipeater up in a good location, where hopefully it can hear other WIDES and cover the area that you are interested in serving. Then, pass the software out to as many packet users as you can get interested it and see if interest develops. I first looked at APRS when it first came out, someone uploaded it to my landline BBS and I decided to check it out. At the time, there was very little activity, so after a week or so, it was DEL C:\APRS*. *. A few months ago I decided to try it again and have had a dedicated APRS station on line ever since. There is a great deal of activity here and it is frequently possible to see stations from as far north as NY and CT at my QTH near Washington, DC. When I show this to other hams, many are very interested and at least give it a try. Not everyone has a computer to dedicate to it, but at least they fire it up and from time to time, get back on to see what's happening.

>>I will see if anyone is interested in attending on the 30th
>>but it sounds like there will be NO discussion on what's the best, it sound
>>like it has already been decided.
>You know, your first message to me about
>this APRS and 5.79 was just last week, up until then NO one had discussed
>this with ANY downstate ESDA coordinators in Hancock or Warren county, now
>all of a sudden it is said we not only need nodes, but they have to be on
>5.79....lots of equipment on 5.79 just for the weather? HMMMMMMMMMM.

Again, I think he needs to see a good APRS net in action to really appreciate what the possibilities are for WX, public service and just plain fun. He has some good points but many would be addressed if he had a chance to play with it and try to do some of the things he wants to do. It's hard to tell, but it sounds like the WX net they are using, or want to use, will rely on connecting to remote maildrops through nodes to leave messages. They can continue to do this, but with the APRS point to point messaging capabilities they will find it much faster to send short messages directly from APRS than node-hopping and connecting to maildrops.

When using APRS on a frequency that has a lot of AX.25 activity, my map screen scrolls up and off as other channel activity appears on the bottom. As a matter of fact, I hardly ever see the status line at all. I am using 68a and don't really remember this happening before on my older version (62, I think).

I was on a 6 month hiatus from APRS due to having no machine for portable use. Have I forgotten something? Or is there something on the freq that is interfering with the good display of data?

See Y'all at Dayton.

APR REPLY: The problem is NODE or level 4 traffic. APRS cannot filter it out but your TNC can. Use BUDLIST to suppress packets from certain addresses such as NODES and BBS's. Also some TNC's have the ability to turn off the monitoring of level 4 traffic all together.. Gud Luk!

381. Graphics Screen Print

For those who are trying to tell fellow hams and others what APRS looks like, try this:

If you've got a recent version of DOS (I have 6.22), include the DOS command "Graphics" in the APRS bat file, before the "APRSxxx" command. Then, when you see something interesting on the screen that you've gotta show somebody, do a "Screen Print".
My 9 pin dot matrix on IBM Proprinter II emulation does a fairly decent job of showing what I can't verbally describe.

Keith, I've heard about aprsm map making in a separate program. Would like to know more, incl where I can get it. I've got the 1:100,000 CDROM maps for HI in optional format, and having not much luck building maps in the DOS environment, due to mapfixer68 locking up. Alot of work, much easier if I had a digitizer, and perhaps that's next. 1.4.2 working well now, thanks for you help. Wish I could join you in Dayton this weekend. Have fun, perhaps you'll see my HF beacons from Hawaii. Aloha, Dave.

Just have to add a note here. I participated in an ARES/RACES drill two years ago and brought along my APRS mobile set up with GPS. All comm was to be on 2 MTR FM simplex using portable (emergency) equipment. No repeaters or fixed antennas. Comms were poor at best due to the distances between sites. I reverted to The APRS message system (back then there were only a few people on here) and with the network in place was able to provide more reliable comms than any other site. This system with the coordination and many relay sites is ideal especially for emergency comms.

A local ham has come across a number of used Motorola 6-channel GPS receivers -
perfect for standalone APRS tracking use! NMEA output (programmable, I think)

Tested, with direct-mount antenna and cable, hookup instructions. (NOTE:
these are NOT handheld display-type units!) I'll have more details in a day or
two when >>> I <<< get my hands on one!

He's asking \$150.00 plus \$5.00 shipping, at least 10 are available.

Direct inquiries to 73227.2220@compuserve.com (the guy that has 'em), or to me
by
e-mail (NOT thru the SIG, please...)

" When using APRS on a frequency that has a lot of AX.25 activity, my map
" screen scrolls up and off as other channel activity appears on the bottom.
" As a matter of fact, I hardly ever see the status line at all. I am using
" 68a and don't really remember this happening before on my older version
" (62, I think).
"
" I was on a 6 month hiatus from APRS due to having no machine for portable
" use. Have I forgotten something? Or is there something on the freq that is
" interfering with the good display of data?

Yeah, its called TCP/IP. That's what wipes out screens around here in
Boston. We have a couple of BBSes on the frequency we use for APRS
[145.77, but may be qsyng to .79!] and they have TCP gateways. When I
see control characters in the channel activity window, the map zooms in,
or disappears, etc. Its either that or the mail forwarding these 2
BBSes are doing on 2m at 1200 baud. I think there's control characters
in that stuff too. Check it out.

John

John Garrett sez:

>

> Yeah, its called TCP/IP. That's what wipes out screens around here in

Awright,

lay off TCP/IP. For real good reasons, it shouldn't be on the same channels
as ax.25 basic traffic. Thats another hard lesson for folks to learn, and a
number of BBS folks haven't learned it. But, in real terms, it should have no
effect on either APRS *OR* on your normal ax.25 traffic. IP merely makes
packet a little more useful for the BBS-type operations a lot of folks want to
do: Mail, file transfers, news, etc. And, since it really IS within the
scopes of a standard, it's got some advantages to some of the other forms of
packet "applications" out there.

If you're seeing control characters out there, and it's from an IP station,
talk to them and see if there's a move to get a "homeland" for IP. It'll
improve their life immeasurably. Oh, and if you think a few blanked screens
is bad, IP can run well beyond the limit of most digipeaters as far as packet
length. This tends to leave digi's locked up and gasping for breath, while
the IP stations continue to hum along just fine.

Basically, for simplicity, IP and BBS activity should not co-exist. Nor
should, in my opinion, APRS and other activities. If we really need the APRS
functionality, we do NOT need to wait for the local BBS to forward 200 kb of
mail to the next BBS...

I have noticed the same problem in my area..control characters messing up
the screen, etc. I watched it for a minute, and it was DEFINITELY bbs
forwarding in my case. These are ax.25 msys bbs's, and using compressed
forwarding. The compressed mail has all kinds of control codes in it.
I have the TNC filter the calls out with my lcalls list. I am willing
to bet that is what is happening in your case, as well.

If you have a TNC-2 or clone, cure the problem by setting MNONPRIN
and/or MNONAX25 to OFF. That should solve the problem.

I would sure like some help in explaining the Unproto path. We are now getting established after a long hard battle and a very long time trying to recruit users. Now we are to a point where we have 4 digi's up and running and all i see from the "D" list is Call,WIDE,WIDE. There is no clear documentation on really the best path to use to get the best performance. I talked to one of the main digi owners, who potentially could be the key to APRS working Great or not at all!. This person stated that it doesn't matter if digi's overlap and can run as much power as they want, he said he has been in packet for many, many years and that all ax25 protocols are alike. Of course i know that's not the case and that you can't handle APRS like a BBS. I sure would like one of the Guru's on here explain what really is THE BEST Unproto to use for all involved. I understand that the prime digi's should use WIDE,WIDE (I guess). But how about the rest of the users that direct there messages to these digi's. Sure hope someone can make this a little clearer then the documentation file within APRS. By the way one of the digi's overlaps another by 50 percent!. Sure like some help with this before it gets out of hand. We have a demo coming up that could potentially make us grow or bust. thank you in advance.

1 picture is worth a thousand words!!

That pretty well covers it don't you think? I work in city government and we are working with Rockwell in Automotive Vehicle Location in conjunction with sending vehicle performance data. This involves a study of electric buses with the help of G.E. and your federal tax contributions which I thank all of you for. We also are in the process of incorporating AVL with Enhanced 911 for emergency services. This will include routing software as well. Government puts a high value on the use of graphical representation, as it adds clarity and fast interpretation to information and reduces human error in those areas.

Just apply the BBS mailbox analogy to these applications and you can see the inefficiencies. If my mailbox had vehicle location info and status I would then get out my map and ruler and the plot that location.

How much better to see the police car flashing red to indicate an officer is down.

Well, I just installed version 6.8b in my computer to replace 67b. I set up all my parameters for the GATE, as usual, and suddenly, this message keeps flashing at me that I shouldn't be using a digi!.

That's a bunch of crap! You HAVE TO digi when running a gate, otherwise, your own signal cannot be seen on VHF...you must reflect back to your own GATE!

Besides, I DON'T LIVE IN MARYLAND....I live in Florida, I have to contend with South American signals plus most of the United States is OUTSIDE THE SKIP ZONE!

So, Bob, I paid you for this thing so how about removing that message, and you can remove that other stupid message about GATE in the VHF path too while you're at it.....It drives KAM users nuts because GATE is in the HF path of the two path line required for KAM input!

I have been supporting APRS since nearly the beginning so let's not forget who the end user is...

I will second that motion, but perhaps he was just having a bad hair day
and will offer an apology. After all he could go back to the previous
version as we all know that running the very latest is to be on the
"bleeding edge".

Rendered body type: text/plain

Okay, yes, I was having a bad hair day when I wrote the message with teeth.

However, I am serious about these little messages that appear directly over the map. There are valid reasons why Relay and Echo exist within the system, and it should be the operators choice on his/her configuration.

If the message came up only once....or it was over in the corner instead of smack in the middle of the screen (and map), it wouldn't be so aggravating.

Please remember there are output wattage limits on 30 M that are much lower than other HAM bands....even with a perfect antenna and terrific radio, the band rarely supports nationwide contact without at least one digipeat of the packet.

If the network is becoming so crowded that digipeating is creating a problem, then perhaps we, as a group, should establish only certain stations as HF WIDE type digipeaters nationwide. This would also eliminate the ECHO problem.

And finally, Bob, PLEASE, I am on bended knee here, could you FULLY SUPPORT the dual port KAM. I would not have to digi on HF just to bounce my own signal back through VHF if the program would transmit through both ports simultaneously. I will mail you a copy of the entire commands manual if it will help. (It is a simple matter, really, just switch datastreams from ~A to JA and back again).

And no, I don't want my money back, I just want the best nationwide and local APRS system possible.

73 to all
Kevin KD4UYR.

Once you have a network set, You should set your UNPROTO to an established NODEs call that you can hit with min power. That way only that one or possible one more will digi your station. Wide should primarily be used when mobile and relay causes muc confussion if everyone uses it. If you have occasion to send to distant station you can change UNPROTO for a short period of time and change it back . I have my UNPROTO set to a NODE I can hit with 0.5watts and have no trouble.

> But how about the rest of the users that direct there messages
> to these digi's. Sure hope someone can make this a little clearer
>

APR REPLY: It ALL depends on the topology. Each person should make his own path to cover the area he wants to cover. If he is at one END and only can hit ONE wide, then he may as well always use the digi CALL. If he wants to go beyond that one, then he chooses the next call in the string. However, if that first digi can hit two or more other WIDE's, then he can just use DIGI,WIDE, and all of these second DIGIS will repeat, at the same time:

```
                                WIDE  
user          DIGI  
  
                                WIDE
```

If a user is symetrically in the middle of a LINE of digipeater, then he can use WIDE,WIDE to go out two hops in both directions.

```
WIDE    WIDE    user    WIDE    WIDE
```

Under most conditions, the packets will COLLIDE back on the originator and APRS may give him a warning that his packet was not digipeated, even though it was, and it did go 2 hops in both directions.. Since both of his neighbor WIDES digi'ed at the same time, they dont hear each other, and therefore do not try to duplicate each other. So there is very little QRM. But if one is held off a second or so due to distant packets, then both may hear each other and the originator may see as many as 4 copies of his packet. But that is the price we pay, until we have a better algorithm.

You should NEVER use WIDE,WIDE,WIDE. Be creative, and selective. Use the path of WIDE,WIDE,DIGI3 in the following example to give maximum coverage in both directions (but favoring the east). (all are WIDES):

```
DIGIwest  WIDE  WIDE  user  WIDE  WIDE  DIGI3
```

Notice that at this point, a user who wants to go 3 hops or more MUST

always FAVOR one direction or the other at any one time...

There are no rules (other than ALWAYS AVOID WIDE,WIDE,WIDE). Each user MUST figure it out for himself because it is COMPLETELY dependent on his location, and antenna/VHF path...

Of course, we often use W,W,W for MOBILES at special events, because they RARELY can ever hit TWO wides at the same time. Since they only hit ONE, then after the first, the condition is not much worse than W,W.

When digis are not in a simple line, then you just have to figure it out based on each station..

APR REPLY: Talked to Wu2Z and I will add the ability for the KAM to transmit onboth the VHF and HF side at the same time. This is so that KAM gateways do NOT have to DIGIPEAT every packet out on HF just to have it digipeated on HF back to his local VHF users...

> while your at it.....It drives KAM users nuts because GATE is in the HF path
> of the two path line required for KAM input!

APR REPLY: I thought I fixed that a while back. Now I only put up the GATE bitch, if I see GATE AFTER the / in the KAM path. If that is NOT working, then lemme know.

REPLY: you have to be sure to do a alt-SETUP-SAVE before they are permanently saved for use next time...

9. Lessons learned enroute DAYTON

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Mon, 1 May 1995 11:52:39 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950501112424.25270A@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

Driving my old klunker with APRS 68a/b running on a FLOPPY CGA 8088 LAPTOP (looks great in the sunshine!) to Dayton made me learn a few lessons plus many comments from users that I will fix soon:

1) The recent move to separate TEXT and MAP screen does not work on this laptop. So EVERY time you depart the MAP screen, and come back it must be re-drawn (1 minute or more)...

A) Therefore, when a Message or an ACK comes in and switches you to the mail screen, you involuntarily loose your map! (another minute wasted)

B) Same goes for sending messages.... (you loose the map)

2) On power up, (3 minutes or more) APRS draws the CONFIG file map (my home town) BUT I WAS IN DAYTON! I will make it so that if you are config'ed for any of the GPS modes, APRS will NOT automatically start up with a MAP display. It will go straight to the P-list so that when your GPS finally gets a new fix, then you may draw the CORRECT map where you are NOW.

A) APRS shows which map it is drawing, but otherwise there is no way to tell which map you are on without asking for a re-draw (BIG pain when it takes 80 secs to draw!)

OTHER COMMENTS RECEIVED AND CHANGES I WILL WORK ON:

3) Make it so that if you are in HSP and turn it off, that you do NOT then have to re-validate to turn it back on....

4) Up the current 99 MAP lables limit

5) if you hit F7 to go to 43 line mode on a cga (my laptop) it crashes

6) Add a new LINE symbol like the NWS uses... "thunderstorms +/- 50 miles of a line between...."

7) Add Police car symbol (exists) to VEHICLES menu (its not there) (useful for plotting "smokey" reports..) (2nd aircraft is also missing)

8) The new NWS WX symbols do NOT show up on the map with the JUST-WX command.

STILL MORE TO CONSIDER.....

8) Add automatic port switching for the PKxxx or was it the MFJ 1278..? SOmeone said that all I have to do is switch Hbaud between 1200 and 300 and turn VHF on&off...

9) Dont release so many versions....

10. Re: [APRSSIG:958] Mail Archive for aprssig

From: Sam_Lipson@berlex.com (Sam Lipson)

Message-ID: <fa507860@ccgate.berlex.com>
Rendered body type: text/plain

The March Archives would also be appreciated.

73, de Sam, K06JR
Sam_Lipson@Berlex.Com

OK it is now MAY !! Could someone push the magic button and have the April aprissig mail posted to the archive dir.

I am missing a week in March about the time several of us seemed to get cut from the list and had to re-subscribe

Thanks
Bob KC5EJK Dallas

11. APRSSIG:927

>

Try ftp.ucsd.edu /hamradio/packet/tcpip/incoming
look for 4 parts if you don't already have the package.
There is pgm, data,info,misc and 1.4.2 was latest available
pgm file last time I looked.

73,
Dick WB6NGC

Absolutely fantastic ideas Bob, I use an old 8088 for full time APRS so
my 80486 is not tied up.....will be nice to improve those things.

14. Re: [APRSSIG:958] Mail Archive for aprssig

I'll try to get that done - but you can get the same thing via the listserv interface.

Just ask for
 index

and then use the command

get aprssig filename

Greg

According to Robert Winingham:

```

Bob Bruninga. I must either be very very unfamiliar with APRS or i'm going crazy (Don't say it). But i can save the unproto path's without any problem , and they do show in the list. As you suggested after enetering the different digi path's i did to a Setup,Save. But guess what when i then restart APRS and attempt to load a certain path (althought in the list) they just will not load. The original unproto path that was entered at the last session is still there. I'm using 68b. Sorry but i gave it all i can muster to make it work. 73 Bill....

I have set up my U-II and plugged in the cable that I got from Peet Bros. Into that cable I have plugged in a Mac to Hayes modem hardware handshake cable, then plugged it into my Mac. What communications settings do I use? Have I done something wrong? I don't find anything in the Peet Bros. or the MacAPRS documentation.

TIA
Bruce

Bob, my comments are: "GO FOR IT"

Any changes to simplify and condense the program would be great.
Also I like the idea of a "GOOD" bug free version that will work. The many version that come out every week or so is KUNFUSING to us mortal souls!
As per my comment to you on the phone.. I'm looking for a "SLIM FAST", "LITE", version with no bells etc. for back ground multitasking and portable use.

Keep up the good work.

73 and cul

Chuck Alldrin Chico, CA.

22. Used Motorola GPS receivers

From: George.Henry@f668.n115.z1.fidonet.org (George Henry)
Date: 02 May 95 11:40:22 -0600
To: aprssig@tapr.org
Message-ID: <107_9505021130@chigate.fidonet.org>
Rendered body type: text/plain

I am forwarding this message, posted to my BBS by one of my users. These are the same units which I posted about before. I have one, and WOW are they NICE!!! (AND a steal at this guy's price.....) The MOTOROLA.BAS program which comes with APRS sets them up in NMEA with RMC sentence output beautifully.

begin forwarded message:

GPS Receivers for sale.

I have a limited supply of USED GPS receivers for sale:

Motorola PVT-6
Active Antenna
New mounts
New RF cables

\$150 , plus \$5 shipping

These receivers are the PVT-6 model in the metal box, built like a tank! They require 12vdc and draw about 150ma. The clock and memory can be backed up with an external voltage source (draws 300ua), I use a 9V battery . When the backup battey is on the receiver it will come up and lock in seconds. The receiver output is set to NMEA and can be programed for GGA, RMC, GLL,GSA,GSV,VTG,ZDA messages.

The receivers can be removed from the case, but you will need to keep the internal interface cables. I will include cable diagrams and basic programming information, all that I have!

If you have any questions please email me at 73227.2220@compuserve.com (I have a new CI\$ mail reader that should be more reliable). If you want to order one please email me so I can save it for you and send the money to:

PalmTop Software
PO BOX 353
Winfield, IL 60190

I already have several orders (thanks George) and I hope I have responded to all of your emails. If you must call, you can try my "office phone" at (708) 649-8590, I check the voice mail often. I have a real job and PalmTop Software is a dream so use EMAIL.

73 KF90A

23. CD-ROM

From: wno1le@fly.HiWAAY.net
Date: Tue, 2 May 95 11:57:36 CDT

I want to get into the CD-Rom map making aspect of APRS.
my question is where can you get these CD-Rom's. I noticed
there are several version if i'm understanding this right?..
Sure would appreciate some info on this subject. Like what's
needed and required to get started, time is no object Hi..

I will second that.

In fact there is a partial answer, that works at least with the macintosh version. MacAprs is able to open a "raw data file", i mean by raw data file an ascii file containing the strings that come from the tnc, as one would see with a terminal program. You just let any terminal program grab the data and save them in the background, and when you want to see what happens you just start aprs and open this file to see all the stations, messages...

I was not able to "import" a raw data file in aprs for PC, is it possible? If not i think this should be a simple (hum, perhaps not so simple for the programmer) improvement to the program.

APR (PC) reply: No. APRS only looks at data off the air. There is a utility program called GPStoHST.bas that will convert raw GPS NMEA data to the APRS TRACK HISTORY format for REPLAY...

Thanks to all for the great APRS demos put on at Dayton...to me (a newcomer) it was worth the trip from New England just to see this exciting new technology. While there I picked up a new TNC and a Magellan Trailblazer GPS to get started. Alread interfaced the Trailblazer to my notebook with Bob's APRS 6.8B and am able to track movement in the car. Next step is to get TNC hooked up whe I return from a short business trip. Thanks again to the Sproul brothers and Bob for a great job.

Message-ID: <199505030209.VAA04580@dingus.n5lyt.datarace.com>
Rendered body type: text/plain

Voice Repeater close to APRS in NYC

For the past several weeks throughout the New York City metropolitan area APRS users have been plagued with the output of a voice repeater system known as the 'KQ2H Repeater System'. The area affected includes Northern New Jersey, New York City, Long Island, and Southwestern Connecticut. This repeater system has inputs and outputs on 10 Meters, 6 Meters, 220 MHz, & 440 MHz. There is no known input on 2 Meters.

However for some unknown reason the operators of this repeater system have implemented a 2 Meter output on 145.795 and have installed the transmitter on top of the 2400' World Trade Center building in NYC. When this transmitter is operating, all APRS activity in the NYC metropolitan area comes to a halt.

After several weeks of monitoring traffic on this repeater system, not once have I heard anyone complaining of interference from packet activity. This would seem to imply that users of this 2 meter output are few and far between, for if there were many users, they would be hearing interference from the APRS packet activity just 5 KHz away on

145.790.

I would like to suggest if there are APRS users that are also users of this repeater system, that they contact the operator(s)/trustee(s) to see if an agreement could be worked out as to the operating characteristics of the 2 Meter output of this repeater system.

I have no qualm with anyone who uses our Amateur Radio frequency spectrum whenever and wherever he or she chooses. However I do have a problem if that use appears to be for non-existing listeners, or is an overkill for the intended area of coverage, or is done without consideration for other users of nearby frequencies.

Hopefully this difference of intended spectrum use can be worked out and we can all make use of the airways in a mature adult mode of peaceful coexistence.

73 - Ed - W9KTH (Southwestern CT)

PS: 10 Meter Output is 29.614 FM (can't find input there either)

30. BUG FREE VERSION WANTED

From: K2ADJ@aol.com
Date: Tue, 2 May 1995 22:34:16 -0400
To: APRSSIG@tapr.org

Rendered body type: text/plain

I have been reading some SIGS today where folks have been asking for not so many updates and want to wait till he has all the buggies worked out of it before it is released..

Well Gentlemen, there are two ways to look at this, yes, Bob can continually hold back until he is assured that everything you fellows hook up to his program will work, that could take months, if not years.. Therefore, everytime Bob makes some changes in his program and it appears to be working all OK, then he lets it out so you fellows can play with it and report back to him any faults that you find with it.. The more faults you find, the better the program will become.. Remember, every time Bob hits the CODE he is changing something and it definitely could affect another part of the program, Bob is no mind-reader, hi.

Also by you picking up the latest release you are on the forefront of the technology of this new tool or toy and can play with something new and by doing so, can see new ways to use this program, that's what it is all about.

If you are one of those that are satisfied with a previous version cause it was bug free, then sit there and run it to your hearts content. Remember, you only PAID for your first release, all these new ones coming out are FREE for you!

Remember MACAPRS by Keith Sproul, he too is a codesmith and I am quite sure that there might be a bug or two in his work but let him know about it and it will NOT be there in the next release!

Now as I step down off my soap box, please, no applause, just throw money...

The last time I heard the KQ2H thing, it signed its call as KQ2H/A which implies AUXILIARY station such as a link. That is only authorized above 220-MHz and I put out a multiline bulletin that inferred someone should contact TSARC and ask about it.

I understand the callsign trustee is unresponsive. What about a certified letter that he would have to sign for? What about a call to the FCC? I would hate to blow the whistle on "one of our own", but if everything else fails...

My QRZ CD-ROM lists the following for that call:

Alex Muzyka, KQ2H
75 Somers Avenue
Bergenfield, NJ 07621

Born: 01-15-65
Previously: KC2FO

Bell Atlantic-NJ Directory Assistance says there are two MUZYKAs listed but with NONPUB numbers.

Hope some of this helps. I too hear that station in South Jersey (Burlington Co), but it doesn't affect us down here as much as it would NNJ, NY, etc.
Good luck guys!

I agree with Rod, K2ADJ, regarding the fact that we are all BETA testers for Bob and Keith, depending on which platform you run APRS. Keeping that in mind, we have to experience the bugs to be able to advise Bob and Keith... otherwise, those bugs will continue to show up in each subsequent release.

I started with version 2.10 so ya'll can see how long I've been on the "leading edge"! My phone bill runs into the hundreds each month. I don't dare tell my wife how many times I've been calling ARN BBS in Maryland just to see if there's been an update posted, Heh Heh.

I say keep the code flowing. I eagerly await even the slightest change even if it is for a feature that I wouldn't normally use. It also allows me the opportunity to ask Bob for something, conscious-free!

I agree. I practice selective upgrading myself. If I have the time I will experiment with the latest versions, if I do not I wait to upgrade and let others do the bleeding. Whatever Bob decides to do is fine by me but the current release schedule works for me.

I applaud Bob and his work. This man is dedicated to his program! I've seen this application continue to mature over the past couple of years and it is refreshing to be able to help "test" new versions.

If persons are having issues with things not quite working right, then I would like to suggest that they use a version with which they feel comfortable.

I'd like to see the updates as they occur.

Please keep 'em coming, Bob!!

It is very easy to forget that this is Amateur Radio and One of the major goals of HAM radio is experimentation. If you want bug free software (if such a thing exists) wait till 1996 and buy Microsoft windows 95.

>However for some unknown reason the operators of this repeater system
>have implemented a 2 Meter output on 145.795 and have installed the

FCC rules prohibit repeaters from receiving or transmitting on 144.0 through 144.5 and 145.5 through 146.00. KQ2H is violating FCC rules with an output there - plain and simple! It is up to the local hams to get the FCC involved to report this guy. Any ham who operates a repeater without knowing the rules needs to be set straight.

Try rechecking the 10 meter output, it should be 29.62 and the input offset should be -100 KHz (input frequency 29.52), according to the ARRL band plan. It is possible that he is ignoring the ARRL band plan as well as the FCC rules.

Joel, I run APRS on my HP100LX. It is slow drawing maps, but it works. I have just the U.S. and my local map. It takes up about 400K on my RAM card. The program needs too much RAM to run it from system manager, so I have to unload all applications.

Anybody have a hint as to how HF Automatic control of digital stations might affect HF APRS operations?

Can an APRS station be in automatic control on HF? Since it is usually "unconnected" operations must be in the specified band sections.

I've included an ARRL bulletin.

SB QST ARL ARLB047
ARLB047 HF auto digital detailed

The FCC has released its Report and Order in PR Docket 94-59, concerning HF digital communications in the Amateur Radio Service. The new rules, effective July 1, 1995, permit automatically controlled HF RTTY and data stations to communicate with one another in the following segments: 28.120 to 28.189, 24.925 to 24.930, 21.090 to 21.100, 18.105 to 18.110, 14.095 to 14.0995, 14.1005 to 14.112, 10.140 to 10.150, 7.100 to 7.105, and 3.620 to 3.635 MHz.

The new rules also permit manually controlled stations to initiate communication with automatically controlled HF RTTY and data stations. In this case the automatically controlled station may use any frequency authorized for such emissions, but may occupy a bandwidth of no more than 500 Hz.

Automatic control must cease upon notification by an FCC engineer in charge that the station is transmitting improperly or causing interference to other stations.

The FCC said it recognized the concerns of those who opposed the proposal on grounds that such operation could interfere with other amateurs, but that it believed the provisions adopted would be adequate to minimize such interference.

More information is on page 71, August 1994 QST.

More feedback to users from comments at Dayton:

1) Someone said that you cannot configure for WIDE, and have it saved in the CONFIG file. ANS: It looks OK to me. I cant find a problem in the code. I did find that if you EVER change from VHF to HF or HF to VHF, that your ALIAS is re-written to either ECHO or RELAY. THAT WILL cause you to loose WIDE.

2) KE4EER and one other station reported difficulty in saving an OPS-DIGI path. I found that it only works AFTER you have saved a CONFIG file and AFTER re-starting APRS. So you are NOT loosing your brains... There WAS a problem, hi hi. Will be fixed in 68c.

3) Someone reported at Dayton that you can DOWNLOAD GPS POST-PROCESSING DIFFERENTIAL CORRECTION data from the University of Iowa at Ames Iowa. This means that you can go backwards in time with a track history and correct it AFTER the fact to plot a precise track. I donno anything more about it than this. Even the addresses above are guesses from the conversation. Anyone looking for a neat project may want to explore this.

4) I am adding DUALPORT transmit for the KAM. APRS will send out TWO of everything. One to the VHF port, and the other to the HF port.

43. KPC-3 can do two digicalls

From: janderson@ram.net (Jack Anderson)
Date: Wed, 03 May 95 17:31:44 GMT
To: aprssig@tapr.org
Message-ID: <15021591.0b9b@ram.net>
Rendered body type: text/plain

Bob,

I just discovered that the KPC-3 has a THIRD callsign that can be used as a digipeater address! What this means for APRS is that it can be used as a RELAY-WIDE digipeater!

The advantage of having every APRS digipeater respond to EITHER the call of WIDE or RELAY completes the "generic" concept already partially implemented. Presently with home stations being RELAYs and digipeaters being WIDES, there are in effect two in-compatible networks through which a MOBILE might travel. If the mobile is far from a WIDE, then his FIRST digi must be RELAY. If he is near a WIDE, then his first digi should be WIDE. By having the digipeaters respond to EITHER, then most MOBILES can choose the path of RELAY,WIDE routinely and RELAY,WIDE,WIDE for long distance events.

Does anyone see a problem with this??

Oh yes, the third callsign in the KPC-3 is the MYnode call. Set MYalias to WIDE, MYnode to RELAY and set users to one and do NOT use it as a node. The NODE call will also digipeat.

" Voice Repeater close to APRS in NYC

"

" For the past several weeks throughout the New York City metropolitan
" area APRS users have been plagued with the output of a voice repeater
" system known as the 'KQ2H Repeater System'. The area affected includes
" Northern New Jersey, New York City, Long Island, and Southwestern
" Connecticut. This repeater system has inputs and outputs on 10 Meters,
" 6 Meters, 220 MHz, & 440 MHz. There is no known input on 2 Meters.
"

" However for some unknown reason the operators of this repeater system
" have implemented a 2 Meter output on 145.795 and have installed the
" transmitter on top of the 2400' World Trade Center building in NYC.
" When this transmitter is operating, all APRS activity in the NYC
" metropolitan area comes to a halt.

[stuff deleted]

Hmm. At least the ARRL bandplan for 2m shows that part of the band for experimental and simplex use. Not that the folks with the repeater won't be gentlemen, but I don't know if that holds any sway with them. Good luck!

When I was recently in NYC, I put my 1W radio with the rubber duck in my hotel window deep in midtown, and had 4-1/2 pages of posits the next morning; I was deeply impressed!

51. MAKEMAPS.bas for 2,000,000 maps

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Thu, 4 May 1995 10:02:31 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950504093521.27607A-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

I received a few weeks ago, a copy of a program written by KB4XF, Jack Cavanaugh of Fredericksburg VA (he wrote it a year ago! but assumed that it was obsolete when MAPFIX came out with CDRom capability) I finally got around to running it. WOW!

This program does the job of the USGS XTRACT.exe program AND my MAPFIX.bas program in ONE step! All you do, is select the state, and give a LAT/LONG and range for the center of the desired map.

It builds an APRS compatible map directly and uses a brute force method to get the number of points down to around 4 to 5000. By limiting the size of your requested map (about 40 miles in the east to maybe 70 in the rural west) you can minimize any effect of this built-in reduction process. If you then load this map into MAPFIX and use the more intelligent alt-SMOOTH command, you can easily get the number of points below 3000 with minimum manual steps.

MAKEMAPS takes from 5 minutes to an hour to run (depending on your machine) but requires NO HUMAN intervention!

Load the result into MAPFIX and successively use the alt-SMOOTH process at 1.2, then 1.3, then 1.4 and so on, until you have the number of points down to about 3500 or so. At this point you may want to go through and manually smooth out some really jagged county lines and eliminate the DUPLICATE second lanes of many multi-lane highways (at these scales, these are always IDENTICAL at all ZOOM ranges) To see if a duplicate line is there, use the FIND command on a midpoint (not an intersection) and then do a CTRL-FIND to see if there is a second point at the same spot.

MAKEMAPS.bas includes everything on the CD except for railroads and administrative boundaries. To see a typical map, zoom into my North Tennessee map TNnorth.map included in version 6.8b. It includes roads, rivers, lakes, and political boundaries.

This program will be posted on ARN by FRIDAY NIGHT, May 5th.

52. CHEAP barometric sensors!

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Thu, 4 May 1995 10:24:56 -0400 (EDT)
To: aprssig@tapr.org

Rendered body type: text/plain

While watching a technician gluing strain gages to a model aircraft wing yesterday, I realized the OBVIOUS way to make a BAROMETRIC SENSOR!

Consider the clear plastic coke bottle. By wrapping a thin single layer flat coil of very fine wire around its mid-section (maybe 10 turns or so, and glueing it in place, you will have a resistive strain gauge around the bottle. Add a wheatstone bridge circuit (where the second balance leg is made out of a similar length of un-stressed wire which will compensate for temperature variations) and you are done!

Hook the wheatstone bridge output to the GAME PORT of a PC, and I can easily incorporate it into APRS!

Anyone out there got time to make this work???

There are TWO specific packages that I need to find:

- 1) something smaller than a coke bottle, but which has the same positive sealing capability (simply to reduce the bulk)
- 2) something similar in size but with a WIDE mouth, so that we can put our balloon payload INSIDE. We have a 60% chance of landing in water around here...

53. Re: [APRSSIG:1000] KPC-3 WIDE/RELAYS! WOW!

APR REPLY: FANTASTIC! This is what I have been hoping for in a digipeater. Not only does it solve the MOBILE's problem, but is also has a very important impact on the health of the network as follows:

RELAY-WIDE NETWORK: With all WIDE digipeaters also being able to digipeat RELAY packets, ALL MOBILES can then set an UNPROTO path of APRS via RELAY,WIDE... They will be digipeated by ANY home station or WIDE digipeater NO MATTER WHERE THEY ARE.

The importance of this capability is that it NOT ONLY SOLVES THE MOBILES problems of how to set his UNPROTO path, but it also removes the contradictory requirements on the WIDE digis. Until now, the need to keep digipeaters WIDELY spaced for network efficiency has been counterbalanced by the need to have more WIDES wherever mobiles may travel.

With the new RELAY-WIDE digipeater capability, we can GET RID OF ALL LOCAL WIDES and RETAIN only the widely spaced (long range) WIDES. The short-range local wides just revert to normal RELAY home stations.

THIS IS THE BEST NEWS TO APRS NET BUILDING IN YEARS!

If your digipeater can be made into a WIDE-RELAY, then include the words WIDE-RELAY in the BText, so we can see it. This is neat! (am I overlooking something???)

Call 1-800-USA-MAPS, it's the USGS. Order either the 1:100,000 or 1:2million for your area, in OPTIONAL FORMAT. Good luck, I ordered the 100,000, and it's difficult, and time consuming. Pointing myself towards doing maps with a graphics tablet. 73, Dave, WH6YC.

A good idea! Temperature compensation might be needed. The bottle shrinks and the resistance drops as temperature falls.

Inside a styro case (with a balloon payload), the temperature change might be too small to worry about.

Strikes me that NOAA might already have "cheap" barometric sensors... from their "sondes" that they put up in balloons... these devices used to be widely available surplus... just a thought..

DUALPORT transmit on KAM. Bob, suggest reconsider your idea on making Kam DUALPORT EVERY transmission on both HF/VHF. A lot of us using both HF/VHF as gateway stations, make xmsns on HF not needed on VHF and viceie versie.. Please reconsider.

Many ops have forgotten capability of (C-H, to transmit on HF side) and (C-V, to xmit on VHF side.) There is enough garbage, over digipeating xtraneous xmissions on VHF now, we surely DON NOT need HF xmsns going out on VHF and or VHF going on HF, you'll BE CAUSING MORE QRM ..

PLEASE RECONSIDER dual Xmsn HF/VHF before doing so. Because of one winner, weener, one FLA disgruntal, don't make misery for all..

Also why the warning on HF for using a Digi, in HF path..?? One digi gets our West coast HF via a MID-US station to you on the East coast, have had several ask me about that. Due propgation other factors one Digi,gate,wide/

aprs via (vhf digi) gets at least one hop for the HF packet..

Again, (C-H, C-V) for alternate xmsns HF/VHF .. Reconsider please.

73's & Enjoy, Bill/WB6LPG @ KA6EYH.#NOCAL.CA.USA, billwb6lpg@aol.com

59. RE: Dual Port APRS

Someone wrote:

>DUALPORT transmit on KAM. Bob, suggest reconsider your idea on making
>Kam DUALPORT EVERY transmission on both HF/VHF

The MACINTOSH version of APRS supports dual-port on the KAM, the AEA PK-900 and the AEA DSP-2232.

When in this mode, it DOES NOT dual port everything, it looks at the data and figures out where the info should go..

If you are running dual port on any of these and a MESSAGE comes in on ONE band, it gets acked ONLY on that band. If you select a station to send a MESSAGE TO, it looks up the station, finds out where it was heard, VHF or HF, and sends the message ONLY on that band.. However, you have the option of overriding this with each message, Usually you wouldn't want to, but you might.

There are some situations where this can get interesting, especially if you have more than one VHF/HF gateway in an area. I handle this by saving where the station(s) where heard FIRST, and only responding to that band.

With experimentation between W02J and myself, we have verified that this indeed works real well. He and I are both running VHF/HF gateways and he can hear me on both bands. However, I always hear him on VHF first, and therefore, I always send the messages to him on VHF.. Before I implemented this, he would see the messages on VHF and on HF and then ACK back on both bands.

60. Garmin GPS-40

From: jlf@achilles.mitre.org (James L. Fisher x6117)
Date: Thu, 4 May 95 13:42:49 EDT
To: aprssig@tapr.org
Message-ID: <9505041742.AA21032@achilles.mitre.org>
Rendered body type: text/plain

Hi all. A local store is selling a Garmin GPS-40 for \$312. How does the GPS-40 compare with other GPS rcvrs, in terms of accuracy, features, and ease of use? What features are missing that I might find useful later (in non-APRS applications)? Is \$312 a good price?

The salesman also said the GPS-40 was the "land" version of the GPS-45, which is more for marine use. How close is that to true?

And lastly, did someone on the SIG say that one of the commercial maps-on-a-CD packages had software that would automatically track/plot your position on the displayed map given the GPS input? If so, what CD package was that?

Thanks much,

62. MacAPRS 1.5.1

From: Keith Sproul <ksproul@hardees.rutgers.edu>
Date: Thu, 4 May 95 14:03:48 EDT
To: aprssig@tapr.org
Message-ID: <CMM-RU.1.4.799610628.ksproul@hardees.rutgers.edu>
Rendered body type: text/plain

Just before Dayton, I announced MacAPRS 1.5.0. I gave out a bunch of copies of this version at Dayton. While out there I also purchased a KPC-3. In the process of messing around with the KPC-3 and a KAM, I discovered a 'gotcha' with the Kantronics units. So, instead of releasing 1.5.0 on Monday, I delayed and am now releasing MacAPRS 1.5.1. This has been in beta test since Monday night...

If you are running version 1.5.0, It does not initialize the TNC correctly so please upgrade to 1.5.1. (This is due to the Kantronics gotchas.)

This version has several new features in it:

***** Speech

MacAPRS 1.5.1 now has SPEECH output for two different things. When a NEW station appears, it tells you the CALL SIGN, and if you get MAIL to YOU, it says
"MAIL FROM WU2Z Hello this is a test"
You can also select a message and REPLAY it later, it then says:
"I SAY AGAIN, MAIL FROM WU2Z Hello this is a test"

This uses the Speech Manager which is built into the operating system. This comes standard with System 7.5.1 and can be installed with any System, 7.0 or later.

This has proven quite useful in that I don't have to watch the screen just to see what is going on. Also I can hear messages from the other side of the room and do not have to run over to see what is going on.

If you do NOT have the speech manager, it simply does what it did before which was to do a Road-Runner BEEP-BEEP on new stations and say "YOU HAVE MAIL" with a digitized voice.

***** Telemetry

MacAPRS 1.5.1 now supports the MIM Telemetry data. There is a new window that lists any telemetry data that has been received.

***** Dual Port support

There were a couple minor difficulties with the Kantronics KAM that have been resolved. Thanks to the people at Kantronics for helping with this. If you are running a KAM in dual port mode, I now know how to do the setup for making the KAM work. Send me E-mail and I will give you the specifics..

***** Map Making

Map Making has been removed and is being put into a new program called MacMapMaker. This program will have many features for doing maps INCLUDING the ability to create PC maps.. See previous announcements about MacMapMaker

***** List Windows

The list windows now have the ability to re-size the columns, this makes it more flexible on the different size screens.

***** History Window auto updates

The history windows (Full history and individual stations) now automatically update as new packets come in.. This was requested by several people.

\$299 is the going price from the marine stores: West, BoatUS, E&B. No tax
if you mail order from Defender.

>

>The salesman also said the GPS-40 was the "land" version of the GPS-45, which
>is more for marine use. How close is that to true?

Pretty close. I'd pick the '45 at the same price because it is not
constrained to
the 8 volt propriatary expensive power supply from Garmin. The 45 will take
anything
from about 6-40 (or thereabouts) volts and you can home brew a supply. The
45 also has a better internal antenna (BNC to helix vs internal patch). Although
for most mobile use yuo'll probablvly buy the remote preamped antenna for ~\$150
for either.

>

Delorme sells what you're talking about, but for an outrageously high
\$4-500. They
sell a fine CDRom map for about \$70-80. In my opinion, all you get for all
that extra
money is a little code that reads the gps input from the serial port and
plots it on
the screen. The maps are pretty and very complete, but stick with APRS.

Ref: klarson@access.digiex.net (Kent Larson) KPC-3 THIRD callsign as digipeat address!. (RELAY-WIDE) digipeter {95-05-04 08:25:26 EDT.

Ref: bruninga@greatlakes.nadn.navy.mil (Robert Bruning) 95-05-04 10:22:31 EDT in
reply.. FANTASTIC --RELAY-WIDE NETWORK: etc etc...

New AEA GPS PK-12 TNC, has similar capability, different wording and may be somewhat confusing with our Kam+ & APRS, use of word GATE.. HF/VHF..

QUOTE: AEA PK-12 MANUAL. Page 38. ""

MYGate call[-n]
call Node call sign used by other stations.
"n" 0 to 15, as optional substation ID (SSID0.
"Call" is the call sign of the NODE function of your PK-12. Stations can connect to your "MYGate" call and then issue a connect request from there. This way, your station takes responsibility for acknowledgments of the user"s packets.
UNQUOTE.....

Whereas the KPC-3 Manual, P-33 states the following :

QUOTE...;
MYNode xxxxxx-n
default MYCALL-7
Setting this command to a callsign or character string enable the KA-Node in the TNC. Enter up to six characters(plus optional SSID) which are different than those used for MYCALL,MYALIAS,MYPBBS, or MYREMOTE. You must also have the NUMNODES command set to a non-zero value. You may disable the KA-Node by setting MYNODE to the same as MYCALL, or setting NUMNODES 0.
See also: digipeat,ndwild,numnodes:KA-Node section.
UNQUOTE

1. Note under APRS, MYCALL-7 gives you and AIRCRAFT symbol. ????

QUOTE KPC-3 p-35

2. NUMnodes n (n=0-6) default 0.
This command is used to set the number of allowable circuits through the KA-Node. For example, if you wish to allow up to 3 simultaneous circuits through the node, set NUMNODES 3. This command will cause a soft reset. Approximately 4K of RAM is used for each circuit. The amount of RAM available will depend on how much RAM has been used for the PBBS, MAXUSERS, and MYREMOTE parameters. etc... (So NUMNODES must be set to a 1, & loss of 4K of RAM in KPC-3) for mobile GPS use may not matter.

Just passed for your info and guidance gentlemen! What now coach ?? Advise

Northern California APRS is on 145.01 High Level Wides are near San Jose, San Francisco, Walnut Creek, Angels Camp, Sacramento, and Chico.

Check in to the APRS voice net on 147.06+ using 100pl on Tuesday evenings at 7:30pm

The Bay Area is vary active with several GPS mobiles showing at commute time and lots of action in the evening.

Not all of us can operate on 145.79. Maybe we should have a couple regional usa maps showing just wide stars with the frequency instead of callsign. There are help files showing frequencies but you know if there were a frequency map travelers could navigate to the right channel.

69. Barometric Pressure Sensor

From: seront@seism1.ess.sunysb.edu (Bernard Seront)
Date: Thu, 04 May 1995 18:42:20 -0500
To: aprssig@tapr.org
Message-ID: <9505042241.AA17814@seism1.ess.sunysb.edu>
Rendered body type: text/plain

I had never understood why a barometric pressure sensor is not included in the U II station. Seems to me that barometric pressure is an usefull info (especially for boats, but also for hurricanes forecasts) .

I would not go for the "coke bottle" solution for two reasons:
-I suspect this sensor will be more sensitive to temperature than pressure.
-You can now find very small electronic sensors at a reasonable cost:

Honeywell has a Barometric pressure sensor(with a piezoresistif element).

Here is the info I have:

Ref Honeywell: 24PCCFA2G

Range: 0-15 PSI / 0-1034 mBar (or hPa)
linearity: +- 0.2%
Stability: +- 0.5%/year

Excitation voltage: 10 V DC typical, current 2 mA typ.
Output voltage: 225 mV full scale (can be use at lower exc. with lower output I think)
Usable between -40°C and +85°C (sorry -40 to +185 F)
NOT temperature compensated (don't know if this is a real problem).
chock resistance 150 G (!)

price is around 20\$ (exact quotation from the French Radiospares catalog is 145FF, which is 29\$, but usually the price increase by a factor of 1.5-2 when these devices cross the atlantic, :-(.

This type of transducer becomes really easy to find and cheap (.i.e. the digital altimeters), someone will certainly come with other sources.
You need to add a small amplifier and connect it to the game port of the pc (why not a temperature sensor on the other game port?) ,et voila, a nice and cheap basic weather station.

For sure, this is an idea to follow!

Bernard, KB2TGH.

70. High Temporal Resolution Tracking

I have a problem that maybe folks here could provide input on:

My application calls for tracking 40 vehicles and 20 helicopters....
the vehicles need about a 5-10 update per minute rate (5-12 seconds between each vehicles update) and a 10-20 per minute update rate for the helo's (3-6 seconds between each helo's update).... upon certain infrequent events - - another update is needed... just to get the time and position of that vehicle/helo when the infrequent event occurred.
All this in real time as APRS does and then the position data both displayed on a map - and available in ASCII form out a serial port - or across an Ethernet - where it will be turned into DIS PDU's for display on another system (DIS PDU's are a network packet protocol used for simulation software... I have the ASCII to DIS solution already.... I need the higher dynamic position information...)

Anyway, I'd appreciate any info any of you might have...

Thanks in advance...

Wondering if anyone out there has successfully setup the new Tiny-2 unit with the internal GPS unit and have it running with APRS.. If you do, can you get back to us with your configuration and any init strings you might have used to configure up the unit.

Thanks..John VE3SVE

I have not tried to make my homebrew antenna yet, but I thought I would pass along the trick one of our local users did.

He has a Motorola Encore GPS card with no active antenna. Being an antenna experimenter, he tried all sorts of things while anticipating the ordering of his own active antenna. Nothing worked: 1/4 waves, hawg fences, helixes, Nothing! Then he came across an old preamp that he uses for 1.2 ATV sometimes. They sell them at Radio Shack as a Satellite TV Preamp (950-1450 MHz or so). It uses a power injector.

He made a 1/4 wave for 1.6 Ghz or so on a piece of PC board and added the Radio Shack preamp at the antenna. The Motorola powered the amp right up the line without using the power injector. He now can GPS with pretty good success.

I *know* that this is not the "correct" way to do this, and that a 1/4 wave is not really right for the pattern we want. I also know that the Radio Shack preamp is not really designed with this in mind, but it sorta worked. It may help someone out someday.

I'm running APRS V68b and i noticed that when hitting the F9 key for centering map on all users it won't work with users West but will with all users East, Strange Bob. My qth is in North Alabama now there where many users on my map, including two stations in Texas when i did the F9 it would center on all the users East of texas but left them off the map???? Explain that one!. I know it worked in 86a. In fact a friend of mine was on the air about 30 miles south going through the same digi and he told me his version 69a centered all stations on the map without any problem. You may want to check that one out. And thanks Bob for informing me that i in fact did not loose my marbles with the unproto path SAVE, i was really beginning to wonder Hi.

Why not just go to Analog Devices and get one of their (many) ICs that do pressure determination, and can be referenced to an originating pressure, OR can be used in differential mode with your bottle (or a sealable metal can) to achieve real delta P measurements. Last I looked, the glue electronics requirement was pretty small for these. I looked at some implantable devices for cows (see, my bovine fixation goes back to the pre-GPS days!) in an artificial heart program 15 years ago.

That's something to start on...I really appreciate it. I saw Nebraska
Surplus at Dayton (they were selling the Rockwell boards for \$195 along with
a passive antenna for \$65 and an active for \$99. They were doing something
that was hard to believe...they had an PASSIVE antenna on the roof of the
Hara Arena going through 8' of coax that was part of the antenna, THEN about
20 feet of RG8 (really) and then a short RG58 jumper to the receiver...they
were getting a fix! Wonder if I was getting scammed or if the Rockwell
receiver is really hot? Hmm?

Well, I've done it with a separate Motorola engine, and packaged it into the
Tiny-2 with Paul's help on the hookups. Worked well. I initialized the GPS
separately to output the desired NMEA strings, and put the TNC in GPS mode.
When I turned it on, it just worked. If you get PacComm to blow the EPROM
without DED-ware, you can use the switch to disconnect the GPS as needed.

Yep. So do the Rockwell, and Trimble engines. It's both easy and pretty standard.

> receiver is really hot? Hmmm?

Why not? I've got a Motorola receiver inside the house, with foil on the fiberboard in the walls, etc., getting 4-6 satellites. It'll probably get more after I get the mask reset to something realistic. And, we get data on our Trimble base station via 100 ft of RG-8/U although they're active antennas.

In my cow package, I use 2-3 feet (less when I can get away with it) of RG-174 and it works fine. In fact, I use up to 10 feet of RG-174 with the Motorola engine, and a passive M/A-Com antenna. So, yes. it can be done.

Simple solution to solve Bill's dilemma....just make the DUALPORT command
an option off the controls menu....like fade and uplink are now, for
instance. Set the default to Off and we disgruntled Floridians can turn
it on when we set it up.

But I am curious Bill, if you aren't digipeating your signal back through
your own gate, how are you beaconing out your posit on the VHF side?

Jon,

Thanks for the info about running APRS on your HP100LX. How much system manager RAM do you think it needs?

The HP200LX has a meg, with about 600 KBytes available. Do you think that would be enough?

I would like to not have to offload the other stuff if I don't have to?

Which version of APRS are you running?

Joel Kandel, KI4T

jkandel@gate.com

On Thu, 4 May 1995, someone wrote:

> In your reply "Fantastic" are you looking for wide digis to use both
> WIDE and RELAY and for all other KPC-3 stations, to use WIDE-RELAY?

APR REPLY: I am definately NOT wanting ANY station except the really well situated long-distance WIDES to have an alias of WIDE. Everyone else should be RELAY.

Having the high well-situated WIDES also respond to RELAY makes the whole network become a homogenous RELAY system. ALL MOBILES may then have their initial path begin with RELAY and take advantage of not only the well situated HIGH sites, but also be able to bounce off of nearby home stations when in distant areas.

CAUTION!: However, this entire discussion only applies to MOBILES! Home stations should NEVER NEED TO USE THE PATH VIA A RELAY !!!!!!!!!!!!!!!!!!!!!

This is because HOUSE's DO NOT MOVE! Every home station is in a fixed location, can usually hit a good digipeater, and has a FIXED path, and can therefore use FIXED callsigns in those paths!!!

FINALLY, there is almost NEVER any justification for EVER having a RELAY beyond the first entry in a unproto path.

> UNQUOTE.....

APR REPLY! Oh-my-GOSH! How could they do such a thing as calling a NODE,
a GATE! Confusion will reign forever!!!!

CAN ANYONE CONFIRM WHETHER THE PK-12 GATE CALL WILL ALSO DIGIPEAT? If it
can also digipeat using that call, then this TNC is also a good candidate
for making a WIDE-RELAY digipeater.

THE OTHER BIG QUESTION THAT MUST BE TESTED, however IS WHEN YOU HAVE LOTS
OF KPC-3's OUT THERE WITH THE SAME NODE CALL OF RELAY. WHAT HAPPENS WHEN
SOME GUY CONNECTS TO THE RELAY NODE. AND THEN ASKS FOR A CONECTION TO
ANOTHER RELAY NODE?? DO WE GET:

FOREVER PACKETS? LOCKUP?

THIS has got to be tested by someone before we go out and start turning
all our (well situated) WIDES into WIDE-RELAYS....

If you have a friend with a KPC3, both set your MYNode call to RELAY and
have a third party connect as noted above. Let us know what happens.

APR REPLY: Actually, a 1/4 wave vertical antenna is not bad! For geometry reasons, a GPS receiver will NOT use any satellites overhead UNLESS it is needing a 3D fix. For 2D (most of us on the ground), the best satellites for a fix, are to the side. Perfect for a ground plane antenna (or paper clip).

I don't think that's correct. I believe that MYRemote is the node name you connect to remotely change your TNC parameters ("root" privileges in UNIX parlance).

Access to the MYRemote node is protected by a pseudo-time-varying password which depends on the user-specified RText string. Here's how that password is determined: (1) You connect to MYRemote; (2) The KPC-3 spits back some numbers; (3) You interpret each number as the character position in the RText string, and that's the password for this connect. (It's a little more involved than that, but that's the gist of it.)

I wonder if the phase or group delay through one of these Radio Shack pre-amps will affect the accuracy of the position reporting. The problem probably wouldn't be apparent with SA on, but when off, it would be interesting to test.

That may be true. I was refering, however, to digipeating NOT to connecting.
If you can digi off a node by making it's call some desired alias then you
should be able to do the same with remote and any other feature.

We just received a Tiny2 MK2 TNC and Ultimeter II weather station and are wondering how to change the TNC baud rate from 1200 to 2400.

We have tried 'BA 2400' from the 'cmd:' mode and we get '?unknown command'.

Any help would be greatly appreciated.

Thanks

de John

Well, if you look back to Bob's comments about TN maps a day or so ago, you will find a comment about the particular maps. If you didn't read your mail, it's not my (OR Bob's) problem!

Go on. Re extract the 68a executable. Feel free.

Thanks for the information, I have been too busy to run the experiment (although with a KPC-9612 and a KPC-3 I certainly could have run the tests). Of course, you must set your real callsign into MYCall, so that only leaves MYAlias and MYNode for our newly discovered purposes.

OK... and the answer is...

The KPC-3 can digipeat as up to 3 different calls/aliases:

MYCALL, MYALIAS and MYNODE will digipeat.

MYREM and MYPBBS will NOT digipeat.

Thanks Gerald Creager, I ask for help but i don't need messages back from you that are sarcastic. Did you ever consider the fact that my internet server has been having problems and that i did not get to read some of the messages. I hope i can do you a favor sometime my friend!. Don't you think it would have been just as easy to answer my question then to send me the message you did!!!!.

For your information i read every message that comes to me via the APRSSIG, and i did not see any pertaining to my question.

SO THANK YOU FOR NOTHING Mr CREAGER.

<Large signature deleted>

Bob said earlier that this was the location of his best map culled from the USGS cd rom with a new MAKEMAP.BAS program. However, there is nothing under that box on my TN map either. Maybe we are missing a smaller map for the inset.

Anyway Here is Bob's earlier message on the subject. Hope it helps, and let me know if you get it working. By the way- I see you popping up all the time on my APRS. Wonder if you saw me today, mobile to N. Carolina thru N GA. Will be doing it again tomorrow (Sunday) look for me if you can.

73
Ralph
N4NEQ

Earlier Msg form Bob:

I received a few weeks ago, a copy of a program written by KB4XF, Jack Cavanaugh of Fredericksburg VA (he wrote it a year ago! but assumed that it was obsolete when MAPFIX came out with CDRom capability) I finally got around to running it. WOW!

This program does the job of the USGS XTRACT.exe program AND my MAPFIX.bas program in ONE step! All you do, is select the state, and give a LAT/LONG and range for the center of the desired map.

It builds an APRS compatible map directly and uses a brute force method to get the number of points down to around 4 to 5000. By limiting the size of your requested map (about 40 miles in the east to maybe 70 in the rural west) you can minimize any effect of this built-in reduction process. If you then load this map into MAPFIX and use the more intelligent alt-SMOOTH command, you can easily get the number of points below 3000 with minimum manual steps.

MAKEMAPS takes from 5 minutes to an hour to run (depending on your machine) but requires NO HUMAN intervention!

Load the result into MAPFIX and successively use the alt-SMOOTH process at 1.2, then 1.3, then 1.4 and so on, until you have the number of points down to about 3500 or so. At this point you may want to go through and manually smooth out some really jagged county lines and eliminate the DUPLICATE second lanes of many multi-lane highways (at these scales, these are always IDENTICAL at all ZOOM ranges) To see if a duplicate line is there, use the FIND command on a midpoint (not an intersection) and then do a CTRL-FIND to see if there is a second point at the same spot.

MAKEMAPS.bas includes everything on the CD except for railroads and administrative boundaries. To see a typical map, zoom into my North Tennessee map TNnorth.map included in version 6.8b. It includes roads, rivers, lakes, and political boundaries.

This program will be posted on ARN by FRIDAY NIGHT, May 5th.

I'll apologize, at this point, for the tone of my message. However, it was engendered by your tone that set my teeth on edge.

I'd like to take an opportunity to suggest we all think before we post to a net resource like this in the future. I've noticed several posts that should have never left the keyboard in the last couple of weeks. Mine spooibly should have been in there.

As to whether your network provider isn't keeping up with the mail, well, I can't speak to that. In my experience, mail outages are somewhat less frequent than a lot of folks imagine: The Internet is considerably more reliable than the US Postal service.

APR REPLY: There should be an excellent map there called TNnorth.map It shows the level of detail available from the 2,000,000 maps. If U do not get that map when you zoom in below 32 miles in the center of the map, then your MAPLIST may be screwed up. FILE-CHANGE-MAPLIST to USA and it should be there...

Thanks for the help.

We want to use Ultimeter IIs as stand alone units for Skywarn here on the Minnesota/North Dakota border.

We have the Ultimeter II and Paccomm Tiny 2. When hooking the Ultimeter to the com port we are getting good data. When we connect to the tnc we are not getting the data sent out to be read by APRS.

We are using APRS 6.8b. I know it is being done. And it is probably in the readme files. I have tried everything that I have read and I must have missed something because I can't get it to work yet.

We want to give a demo to the NWS guys who are presently moving into our town so any help will be greatly appreciated.

Thanks for the help.

Gerry Nies

See README\WX.TXT

Set the GPS string in the TNC to * (or # whichever is the first character out of your U-II). Set ECHO OFF. Bias the output of the U-II as necessary to give good +/- transitions on the input of the TNC. Set LF IGNORE ON, and set the transmission rate for the LText to your desired period. Then put TNC into GPS mode.

Good Luck.

I talked to Keith Sproul this weekend about this. The Terminal menu item was accidentally left turned on. This portion of the program is still under development. I expect a new version will be out shortly. Best thing is to not use that menu item.

Hope this helps,
Bruc

127. APRS & KAM PROBLEM

From: "John W. (Bill) Hays, W00MV" <billh@INS.INFONET.NET>
Date: Mon, 08 May 1995 10:43:08 CST
To: aprssig@tapr.org
Message-ID: <009900B8.F9054E10.445@INS.INFONET.NET>
Rendered body type: text/plain

Any ideas for Bill et al?

Original from WB0BBM to KB8IFX@N8JSF.#CIN.OH.USA.NA
Hello, name here is Bill wb0bbm
I have a Kam and have the same problem. Started with 68 for me also.
I tried 68a and 68b and also into an older Kantronics single port tnc.
Same problem with all. That was with two different computers.
Loaded into my laptop and hooked to mfj 1274 and no problem.
Well there is good news and bad news. I know whats wrong but can't figure out the fix.
The tnc config file is setting parity at 0. Well on the Kam no parity is 4.
If you do an (o) for operations then (c) for comm and then (t0) for tnc
Hit enter for the cmd prompt. You probably won't see anything but garbage,
but go ahead and type PAR 4 and then it should work from there.
I don't know what line in the tnc initialize file is doing it.
If you figure out what line to change please let me know.
It works just fine after I change the parity.

73's and good luck. Bill WB0BBM@w0bxx.ecia.ia.usa.na.

73, Bill W00MV

128. APRS ver 68c

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Mon, 8 May 1995 13:21:47 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950508130947.24926B-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

Here are the changes. Most are minor and 68a still looks good.

Ver 68c: Lessons learned at Dayton while driving with floppy CGA laptop!
* Boots up to Plist vice MAP in GPS modes so it does NOT draw HOME map 1st
* Fix so CGA's do NOT crash, but ignore F7 switch to 43 line mode.
* NO auto-switching to READ scrn on CGA's due to SLOW map-redraw requirement
* MAPS-WHICH command lets you see what map you are on
* alt-SETUP-GPS-NOgps can be toggled on/off without needing to re-validate
* Added Jet and Police (smokie reports) to symbols selection menu
* Added NWS watch/warning box to OBJ-AREAS (x miles either side of a line)
* Killed OBJ's now fade to gray
* Default is MAPLIST.USA, vice .APR. Users must learn CHG-MAP1st command
* Removed DF validation prompt unless you are DF configured.
* Automatic HF/VHF switching for PK-232 (un tested)
* SETUP-OTHER-AGL sets average Gnd level so Mobiles do not FLY in 3D
* increased WX alarms to 999 to avoid alarms on garbles
* Added dual port KAM transmission. see HF.txt and CONTROLS-2PORT command
* I think I fixed the CONNECT=> BLUE COMM SCREEN problem
* Added ARNAV parsing experimentally in the SPM mode.. Can anyone test?
* MAP-LOCK no longer tries to load WORLD map everytime
* Fixed F9 (CENTER) command. It had been ignoring calif
* NEW MAKEMAPS.bas greatly simplifies making 2,000,000:1 maps. See CDR0M.txt

Version 6.8b:

- * DX cluster MODE had NOT worked for new users since v67 because I had moved DXcalls.DAT file to the APRS\SYSTEM directory but forgot to tell APRS to look there! Old users still had a copy in APRS directory so it worked
- * New CONV100C.bas by W7KKE no longer crashes on building city street maps
- * At suggestion of N4BYU, added NWS symbol distinct from other WX symbol
- * Increased APRS MAX beacon period from 12 mins to 40 mins if unmanned
- * Improved MAC symbol
- * Eliminated Dupes of max-length lines on Traffic display.
- * APRS now warns LID's using DIGIS on HF
- * Telemetry page now refreshes in real time and displays in LAST first order

I keep wanting to add the remote phone-line dial in capability, but wonder if anyone will really use it? I know that I can not justify the extra \$20 per month for a phone line dedicated to this purpose. And although it will be neat to dial in to california and see what their network looks like, I cannot think of any JUSTIFICATION in an emergency tactical network for which APRS was designed. (assuming of course that phone lines are out).

Or to say it another way, I think many of us would enjoy the dial in capability for fun, but is there any of us that would dedicate a phone line to this application to satisfy everyone else? I'm going to investigate whether a phone line at work (not used at night) could be made available...

129. can Baycom do APRS?

I think this feature would be great for a landline bulletin board such as Frequency Forum or ARN! If there was a bbs menu option that would perform something like a DOORWAY but to a running processs, APRS, it would really open up the number of users of APRS to people wanting to see local wx or a public service event in real-time.

Neat idea but I don't think the BBS software would support it unless it were in Unix or OS/2 -- a true multi-tasking operating system.

Rendered body type: text/plain

Well now that I have posted APRS68c (size = 376K), I went ahead and removed all DX stuff, the auto DF interfaces, and the NATL-Grid-REF for England and the CW routines to try to make a smaller EXE. The result was only 23K smaller, and probably NOT worth the effort. This program is identical to 68c except for the removals and is called APRSG.exe (for GPS...) It is 353K.

If this size reduction makes any difference to anyone, please let us know. Otherwise the hacking and potential for making new bugs in the process is probably not worth the risk. I will probably use it on my 8088 floppy laptop to give room for one more map.

If this extra 23K makes any difference in running TSR's or running under windows or os9, or anything else lets us all know... The program will be posted as APRSG.zip but only has the EXE in it.

You are probably looking at an application where a user running APRS uses it as a term program to dial into another APRS. In this scenario, ONLY the ASCII data is sent over the phone line - not graphics. The calling APRS uses the ASCII position and beacon data to build its maps much like it would if it were listening to a local TNC. The APRS being called would act as a server, dishing out the same ASCII data it sees on its TNC com port to the modem port. The calling APRS is the client, using this low-level data to build its map. The contents of the P-list and other screens could also be transferred at the beginning of the session to bring the client up to date with the current screen being displayed at the server.

DOORWAYS and similar facilities work pretty good with ASCII text and ANSI

graphics but EGA graphics would be slow to send over a modem. APRS does not share the CPU well in multitasking environments either. I ran it along with my three BBS tasks under OS/2 and it brings everything else to its knees. It isn't designed to work in an multitasking environment so it doesn't care how often the keyboard is polled, etc.

Using the above example, a BBS could be set up with a TNC in "listen only" mode, spitting out raw monitored packets. Imagine an APRS with a "modem" screen, kind of like the screens we see today in APRS to talk directly to the TNC. User does ATDT ###-###-#### and brings up the BBS call, then doors to the door with the TNC data, then "Resumes APRS processing". APRS then listens to the data coming across the line, real time, until the user is done. This takes up a lot of valuable connect time on the BBS though. Better maybe to build a P-list and other files and let the user download them to get an instant snapshot of the current map and all activity for the last hour.

This begins to open up a bunch of interesting possibilities. Forgive me if this has been discussed before, but consider the possibility of using the Internet to wormhole multiple APRS nets together...this is being done with other packet networks and there's no reason why it couldn't work for APRS either.

Gerry Nies wrote:

Thanks for the help.

We want to use Ulitmeter IIs as stand alone units for Skywarn here on the Minnesota/North Dakota border.

We have the Ulitmeter II and Paccomm Tiny 2. When hooking the Ulitmeter to the com port we are getting good data. When we connect to the tnc we are not getting the data sent out to be read by APRS.

We are using APRS 6.8b. I know it is being done. And it is probably in the readme files. I have tried everything that I have read and I must have missed something because I can't get it to work yet.

We want to give a demo to the NWS guys who are presently moving into our town so any help will be greatly appreciated.

Are you using the same cable? The TNC is a Data Communications Device: it expects data to be transmitted to appear on pin 2. If you had it feeding data to a PC serial port (Data Terminal Equipment), you had the data appearing on RXD, pin 3. You either need a null modem adapter or to wire your cable with pins 2 and 3 switched.

I ran into the same problem when I first tried to wire a stand-alone GPS.... the TNC just wasn't getting the data 'cause I had the cable wired for the com port! Just threw a R/S null modem adapter in line and it went nuts.

Hi fellow APRS'ers I have a questions about legal ramifications of APRS unmanned activity..well not quite unmanned. Let me set the scene:

I have pretty close ties to the Police Commissioner here in town and was telling him about the exciting new twist in my hobby that APRS has brought about. Being a former public servant (former CD Director & on the Fire & Rescue Department) I began to talk about applications revolving around public service. Let's cut to the chase..towards the end of the conversation he all but offered to allow me to but a GPS packet beacon on one of his

police cruisers for experimental purposes. My selfish reasoning is of course to satisfy my technical curiosity. However looking at the public service point-of-view it would be nice to track the pace vehicle in a bike or road race (which I'm sure many of you have already done). I'm really looking at the possibility of getting some map coordinates of our town with little effort.

I told him that in any case that the application could not be used for any routine police business except in the case of extreme, life threatening situations. Now...is the station in the truck of the cruiser a beacon station, unmanned packet digi, or simply illegal? When you guys track road races...and put stations in ambulances...is there an operator in the ambulance? How are these classified? Balloons?

Thanks,

Tim Smith

Just downloaded version 68C....

Double kudo's to Bob (APR) for 2Port....been waiting a long time for that... and thanks for moving that nasty DON'T DIGI! message to a place where you know its there but it doesn't block the map.

PS...KAM code working great...even on my old version 5.0 ROM...

Short note for those running KAM gateways...I did notice that if you switch to the O/C/T screen....you will be in the mode you were in before you turned on 2PORT.

Keep up the good work!

I am looking to purchase a GPS, and my question is, is there certain GPS models that work great, and ones to avoid? I have been looking or hearing about the Garmin 45 for around \$200 dollars, I have access to a KPC-3 version 6 software which has GPS capabilities? I would like to know if this is true, and basically what it does, cause the doc's that come with the new KPC-3 is the version 5 manual.

If I buy the Garmin 45, and have the KPC-3, do I need to build a cable?

Where do I get the format to build this cable? I want to run this in the car, how about an antenna? I heard a quarterwave works, is this true, cause I have an extra. I just want to know how much more money has to be invested to get this up and running. Does the Garmin, tell direction and speed? I would like to have that also, even altitude available at my drivers side.

What is the difference between the garmin 40 and 45? I don't have a portable computer for the car so that is why I need self contained working APRS GPS setup.

Hi,
I am running the Ultimeter II with APRS and it works great but after about a day of running, I will notice that APRS locked up cause it says SENDING TO TNC in the upper right hand corner in yellow and its stuck, I also took note it happens after it puts TRACK HISTORY information next to my station. Does anyone have this problem? It must be something with it sending data to the TRACK HISTORY that locks it up. Your information is helpful

Subject: Houston BLT-10 GPS status

Our mail system crashed today and the following may not have made it out! Apologies if this is a duplicate ...

Notes on the balloon GPS status system de W5SXD - 8 May 1995

The BLT-10 balloon GPS package consists of a Motorola PVT6 GPS engine, a Kantronics KPC-3 TNC, and a two meter FM transceiver that puts out about 500 mW.

The following four packets are transmitted every 20 seconds from the GPS package:

W5SXD-9>BUF1 [95/05/08 13:08:25]: <UI>:
\$GPGGA,130808.00,2937.13,N,09537.16,W,1,04,2.3,-118.1,M,-23.2,M,,*71

W5SXD-9>BUF2 [95/05/08 13:08:25]: <UI>:
\$GPGSA,A,3,14,18,,29,,22,,,,,5.8,2.3,5.3*3F

W5SXD-9>BUF3 [95/05/08 13:08:26]: <UI>:
\$GPRMC,130808.00,A,2937.13,N,09537.16,W,2.0,301.0,080595,0.0,E*4B

W5SXD-9>BUF4 [95/05/08 13:08:26]: <UI>:
BLT-10 GPS test system de W5SXD, Sugar Land

The first three contain standard NMEA sentences. The \$GPGGA sentence contains the time, lat, lon, quality indicators, and height in meters. The \$GPGSA sentence contains a list of the satellites being used along with more quality indicators. The \$GPRMC sentence contains the time, lat, lon, speed over ground, course over ground, and the date. The BUF4 message simply contains information about the system and is only transmitted once per minute.

The W5SXD status software runs on a ground station. It grabs the NMEA sentences as they are transmitted, builds two status packets, and then digipeats the status thru the balloon package. At the time these examples were recorded, the package was in Mike, WA5TWT's house with a discone antenna on the two meter transceiver and the GPS

antenna outdoors. Mike's place is about 1.5 miles south of W5SXD.

```
W5SXD>STATUS,W5SXD-9* [95/05/08 13:08:33]: <UI>:
!3 95-05-08 13:08:08 balloon status de W5SXD
GPS: 3D 4 sats HDOP 2.3
lat 29 37.13'N, lon 95 37.15'W, -387.5 feet msl
moving 2.3 mph at 301 true over ground, climb -93 fpm
!
```

The first status packet contains GPS derived information about the package location. The message is bracketed by the ! characters. The first line contains a message serial number, the GPS date and time. The serial number, 3 in the example, is bumped for each new status packet. The second line contains the GPS status and quality. In this example, the GPS was operating in 3D mode using 4 satellites and a Horizontal Dilution Of Precision (HDOP) of 2.3. The third line shows the latitude, longitude in degrees and decimal minutes and the altitude in feet above mean sea level. The GPS accuracy is stated as being within 100 meters 95% of the time in the horizontal and within 200 meters vertically. Mike's house is about 20-30 meters above sea level so the vertical error is within specifications. The last line shows the speed over ground in miles per hour and the course over ground in degrees from true North. The climb rate in feet per minute is calculated from two adjacent fixes.

An example of the second status packet follows:

```
W5SXD>STATUS,W5SXD-9* [95/05/08 13:08:35]: <UI>:
#3 to balloon from (loc:az/el/dx) de W5SXD
SR5:052/000/041 SGR:095/-02/002 IAH:214/000/030 HOU:265/000/021
AUS:110/-01/133 BMT:250/000/090 SAT:087/-01/172 DFW:159/-01/241
ACT:145/-01/167 MSY:267/-02/323 GLS:298/000/052 SHV:209/-01/222
#
```

This packet shows the azimuth, elevation, and slant-range in miles from 12 airports to the package. The three letter codes are the nav beacon callsigns for the airport. This packet is bracketed by the # character and also has a serial number at the beginning of the first line.

The airport codes are:

- SR5 - Wharton, Texas (The launch site)
- SGR - Sugar Land, Texas
- IAH - Houston Intercontinental
- HOU - Houston Hobby
- AUS - Austin, Texas
- BMT - Beaumont, Texas
- SAT - San Antonio, Texas
- DFW - Dallas-Fort Worth, Texas
- ACT - Waco, Texas
- MSY - New Orleans, Louisiana
- GLS - Galveston, Texas
- SHV - Shreveport, Louisiana

This system will be first tested on the Clear Lake balloon launch currently planned for 13 May 1995.

Regards, Richard Allen, W5SXD, Sugar Land, Texas

>Does anyone have better maps of the Middle East (gulf Region)?

I am working on maps of the world.. I have some CDs with GOOD detail of the rest of the world, and am working on being able to create maps from them. The program I announced a couple weeks ago, MacMapMaker, will enable the creation of this type of maps for the PC and the Mac versions of APRS. I hope to have this program in beta by the end of the month or early June.

>What is the meaning of the data in the \$GPGBGA string....

The rest is
0/1 flag saying if the signal is valid
0-6 number of sats currently being used
n altitude
M unit of altitude
n height of geodetic sphere
M unit of altitude
and I think one or two other fields..

the *xx at the end is a checksum and can be ignored..

I had this problem too. I was running it on a 386-25 with a 16450 UART equipped serial card. The problem disappeared when I installed a new 16550 UART equipped serial card. APRS now runs for weeks at a time.

Only 23K? As a gov't employee I know that there's always room for more cutting.

I currently run 62C at 328K on a 2M HP Palmtop without trouble. I'll probably upgrade to aprsg and not the 68c just because I don't need the extra features, and not because I'm running out of memory (yet). I do hope you'll keep a stripped version available just because I believe in economy, something like operating qrp whenever possible.

Garmin has taken over the market share for low cost GPS handhelds with their 40 & 45. Both retail at \$299 and are good reliable stand alone position finders with course speed & waypoint navigation, but you'll need to spend another couple of hundred for the bells & whistles for remote antenna, remote power supply, I/O support, etc. If you're good at home brewing you can do some of that yourself with the 45 which has a BNC antenna connection and better power latitude. They both give altitude, which like all GPS units, isn't very good without Differential correction - which means hooking up a 300KHz (that's right KHz - dumb Coast Guard) receiver. Both units stop computing when your speed reaches 90kts (103mph) which shouldn't bother you unless you're a pilot or drive awfully fast.

There is a lively discussion of this subject on sci.geo.satellite-nav where they discuss cable making, pinouts, etc for home brewers. I don't know anyone who's the 40 or 45 with a TNC, but I'd expect it to work fine. I use an older Motorola myself.

Yeah, it's a system hog alright. But that's ok, it is getting pretty
efficient on a straight DOS box.

I like the idea of the bbs periodically building all the lists and maybe
an HST file for people to download. This would not tie up the bbs and
therefore might encourage ll bbs' to offer the service. The lists could
be updated every 10 minutes or so and be more "real time" so to speak.

How about an ftp site that could be feed files from several APRSNET sites
around the world. Using your scenario above, the remote APRSNET sites
could periodically upload APRS files to the main ftp site for people to
download as they wanted. If the site were a WWW site then the files could
be bitmaps of the latest APRS data that was displayed on a screen.
Automating the screen snapshots and possible conversions might be a
problem. Managing the files at the ftp site might be a bigger problem. :)

I haven't seen any discussion of this topic on the SIG before.

And I'm not bashing it - but DOS programs typically aren't multitasker
friendly unless an effort is made to design the program that way.

I'm thinking more of a service like the "chat nodes" except they are fed with
APRS raw data instead of messages typed by users. Let the TNCs do the
typing, then anyone with an Internet-equipped APRS could log on and just
"listen", and even throw his/her own data into the link.

A more useful application would be to link areas on different frequencies or
too far away from each other for reliable direct links. Have a TNC on one
end retransmit all heard data to the "APRS Chat Node" and on the other end, a
TNC to pump this data out over the air.

CLINTONS REPLY: Don't ask, Don't tell. hi hi

It seems that most TNC's are left unattended most of the time. WWhen one
builds a stand-alone-tracker and puts his call in it, he is taking
responsibility for the technical emissions and operational application of
the device. He should continue to monitor its operation and be prepared
to cease operations if the device causes interference or if it is being
operated in a manner not in conformance with the FCC rules. Whether it
is at arms length, in your driveway, or across town, it is performing the
task that you programmed into it.

I think that the scenario that you discussed is just fine. It shows that
HAMS are still on the leading edge, and demonstrations of new technology
is a fundamental plank of the amateur service.

149. dial-in feature

From: jlf@achilles.mitre.org (James L. Fisher x6117)
Date: Tue, 9 May 95 09:28:40 EDT

Message-ID: <9505091328.AA00363@achilles.mitre.org>
Rendered body type: text/plain

Related to Jack Anderson's comments on the dial-in client/server APRS model
where only ASCII data is sent over the phone line...

The suggested implemtation sounds similar to another capability I'd find
useful: to be able to let my TNC, via a VT100 emulator, dump to a file all
night and then read this "raw" file into APRS*.exe the next day and have the
APRS data displayed. (My portable pkt station uses a tiny Baycom modem on a
laptop, and the Baycom TNC software and APRS*.exe can't work together...yet.)

This capability would also useful on "non-APRS" frequencies where BBSs, digis,
and nodes beacon their position in APRS format. Then I could have a position

map made automatically for me, and I wouldn't have to manually extract the data. (This assumes the "raw data" reader simply ignores all strings not beginning in APRS format.)

> Short note for those running KAM gateways...I did notice that if you
> switch to the O/C/T screen...you will be in the mode you were in before
> you turned on 2PORT.
>

APR REPLY: The exact implementation is as follows:

- 1) The KAM is still operated in the HF or VHF port mode that it was/is in. In other words, ALL packets will be originated on the selected band.
- 2) When you shift to 2PORT mode, the KAM still does everything on the selected port, but then temporarily shifts to the opposite mode and sends a duplicate copy of ONLY the following packets:

POSIT, BEACONS, OBJECTS, ACKS

It does NOT send MESSAGES, Queries, or Pings, etc

The rationale is that some HF msgs are transmitted for hours or days until ACKED, so duping them onto VHF adds a lot of QRM. You will need to use the CONTROLS-HF or VHF command to select the band on which you are PRIMARILY communicating. Unfortunately, the 2PORT flag covers up the HF/VHF band indicator (although it is there). I will change this in my next release, so that it displays something like 2HF and 2VHF so you can still see which band is primary.

GGA is time, lat, long, 1/0, #of sats, HDOP, height, Gsep, age, ref

where 1/0 indicates if fixes are good or not
HDOP is horizontal dilution of precision. (a measure of precision)
Gsep is the actual difference between the geoid and sealevel
age is the age of the last differential correction
ref is the reference station used for differential correction

> -----
```

APR CAUTION!!!! APRS WILL NOT TRACK THIS BALLOON! (unless....)

There are 5 things that will prevent APRS from "seeing" this balloon.

- 1) APRS only monitors UI frames to the generic addresses of APRS, BEACON, QST, CQ, SKYWRN, SPCL, etc. It will NOT see packets to BUF (Unless the APRS user remembers to set CONTROLS-OTHER ON)
- 2) The default APRS Balloon symbol will only be used if the SSID is -11 (or if another UI frame is transmitted with the symbol char enclosed (in braces. See SYMBOLS.txt)
- 3) APRS must see the NMEA data on the same line as the packet header (turn Headerline off for receiving TNC)
!!! BE SURE THAT LFIGNORE is ON in the transmitting TNC if you are using a straight through CONVERS UI mode!!!!!! Otherwise EVERY packet will be transmitted with a LEADING LF!
- 4) APRS must see the NMEA data as the first data after the colon following the header (in these packets, there is a <UI>: inserted at the beginning of each packet (turn MCOM off)
- 5) APRS must NOT see the DATE-TIME stamp inserted on the received packets. (Turn MSTAMP off)

NOW OF COURSE, THE ABOVE "PROBLEMS" 3 - 5 are probably the result of the setup of the "RECEIVING" TNC and NOT of the transmitting TNC. And, of course, the originator of that message was NOT using APRS but had his receiving TNC configured for the best HUMAN display. But I thought this was a good opportunity to remind everyone of what APRS DOES like to see:

```
W5XSD-11>APRS:$GPGGA.....
W5XSD-11>APRS:$GPRMC.....
etc
```

I hope this helps other balloonists. That leading line feed which can get in there when using an OEM card driving a TNC in UI CONVERSE mode is a KILLER! It cannot be corrected at the receiving end. and APRS will NEVER decode a posit.

- - - and to poorly paraphrase blah blah blah.. the reply was (again
poorly
paraphrased) - - the full content not being important for my question.

>Garmin has taken over the market share for low cost GPS handhelds with
>thgeir 40 & 45. Both retail at \$299 and are good reliable stand alone
position
>blah blah blah
>Bob Kirk
>N30ZB

Two requests.... 1) where can I get Garmin 45's at \$200 or \$ 300.... the
Marine equipment suppliers I deal with charge \$300 for the 40 and \$400 for
the 45... I'll buy several 45's at \$200 and a couple at \$300.... BTW - -
at these prices for GPS the Coasties should shut down LORAN ASAP.... 2)
folks - please put your INTERNET address with your Signature block... I
like seeing many of the postings here... but I would also like to reply
directly to some with specific questions... however, the reply
address I get here is the APRSSIG address and I'm reluctant to ask the
questions and have them cluttering up everyone's mail....

This SIG has been a great resource in my efforts to determine what might be
necessary to track Helo's in a simple (read that not spending BIG \$\$\$)
manner. For those that may be concerned with the high dynamic direction of
a previous posting of mine - I will not be using HAM freq's - just Gov't
ones... but I need the rapid position update rates. To the individual that
mentioned the KPC-3 time slotted broadcast technique... THANKS !!! this is
much better than the slotted ALOHA approach my system was headed for... I'm
"pulsing" Kantronics to see how you can assign different trackers - -
different time slots...

Thanks in Advance

The prices are \$300 for either the Garmin 40 or 45, available at West Marine,
BoatUS, Defender Industries. They all have 800 #'s for catalog ordering,
and match each other's prices. No one sells for \$200, and remember the
hidden extras.

Warning: as I said, neither of those units will work over 90kts, so you'd better have slow helos. I think that's a ploy by Garmin to force aviators to buy their more expensive aviation version, which is essentially the same as the 40/45 without the software stopping computation at 90kts. In my world we use GPS on satellites going at 20,000mph, and computation is not a problem.

I have received several messages from users having the same problem i'm having and that is there's not anyone willing to give us any information on how and what you have to do to be able to make maps using the CD-Rom. I have connected to the USGS map service. There are many, many maps available their but i'm still confused as to the format required. I have seen a question posted here before asking this same question. Fellows the maps are available, but it would be great if some of you Guru's would share your knowledge with some of us that are not experts in this field. Maps are available in the 1,000.000 and the 2,000.000 resolution. They are even available for City's within your state. And yes i did read the mapmaking doc files, but they assume your already familier with how to do this. I was planning on ordering a CD-Rom but right now don't have no idea at all on what to order!. So please fellows share some info with us users that also would like to have better maps.

160. APRS & CDs !!!!

From: Keith Sproul <ksproul@hardees.Rutgers.EDU>
Date: Tue, 9 May 95 14:27:46 EDT
To: aprssig@tapr.org
Message-ID: <CMM-RU.1.4.800044066.ksproul@old-hercules.rutgers.edu>
Rendered body type: text/plain

Regarding all the questions about the USGS CDs

There are TWO main types of CDs.. One is the 1:2,000,000 CD, which is a
YELLOW cd. Both the Mac and the PC support this CD.

The other one (Set) is 1:100,000 scale CD, which is also supported by both,
but on the PC, ONLY on a small scale due to the large amount of data on this
CD. The Mac version that supports the 1:100,000 has not been widely
distributed, but will be fully supported in the MacMapMaker program.

The thing that has added some confusion is that for the 1:100,000 data, it
is now up on Internet, and is available in BOTH Optional and Standard format.

The 1:100,000 CDs are ONLY available in OPTIONAL (Except for Florida, be
careful). Currently, the Optional format is what is supported by the Mac and
PC programs.

I am working on a NEW program that will do CONVERSION of !!!ALL!!!! of these
data types to BOTH PC APRS map files AND MAC APRS map files. This program
will run on the Mac, but will have FULL editing and data reduction
capabilities..

This program is called MacMapMaker and should be out sometime in early June.
Yes, I know it only runs on the Mac, but it will be VERY useful for the PC
people in that it will solve a lot of this map data format confusion. The
documentation will explain in gory detail all of the different types of data,
where they can be acquired (free via Internet, or how to buy the CDs).

Below is the original message announcing this program...

Keith Sproul

Begin of forwarded message..

As most of you know, I write the MACINTOSH version of APRS, called MacAPRS.
This program is fully compatible with the PC version as far as the on-air

protocols go. Bob and I keep in touch and make sure that anything done over the air is coordinated between us.

Over the past few weeks, there has been a LARGE discussion about how difficult it is to create good maps on the PC. Those that have seen BOTH the PC version and the MAC version have been very jealous of the Mac's Map creating capabilities.

In fact, several people have asked "Why don't you create PC maps?" or "I wish I could create maps that easily!"

Well.. I am working on it!!!!!!!

I discussed this with Bob last night, and although I have told a few people about this, I had not given a lot of details. Here goes the details..

So far, the MacAPRS program has had the capability to create MAPS from within the program. It could convert PC maps, it could create maps from the USGS 1:2,000,000 CD (what most of the maps are from) It could also create maps from the USGS 1:100,000 CDs (See the Feb issue of 73 magazine for an example) and it could create maps from a couple other sources of map data. In fact the stuff that is supported or is being worked on is growing almost weekly.

The problem with this 'GROWING' was that there was getting to be a LOT of stuff in MacAPRS just for creating and editing MAPS!! About a month ago Mark, KB2ICI, (my brother and co-author of MacAPRS) and I decided that it might be a good idea to separate this map making/editing out into a new program.

So, I am now announcing MacMapMaker (MMM for short). This program will do ALL of the current map stuff supported by MacAPRS, it will allow EDITING of the maps and will have the ability to create map files for the PC version of APRS.

MacMapMaker will have LOTS of editing capabilities, color selection, line smoothing, line adding, deleting, dynamic point reduction (For the PC maps) This will show you the CURRENT map, show you what it would look like at the next level down, i.e. data reduction, etc, so that you can keep playing until you get a map with small enough number of points, but high enough detail to get the job done.. You will be able to merge data, delete sections, most anything you could think of in editing/creating maps.. It will also support different coordinate systems such as Lat/Lon, UTM, State-Plane, and the different GPS Datums available.

To be able to do a lot of this type of high-end graph theory takes a fair amount of work and effort. This program will NOT run on a Mac Plus, it will require a color Mac and at least 8 meg of memory, but this is what you need to be able to this level of graph theory and data reduction..

The base program will probably be demo-ed at Dayton, and I expect to have PC map creation done sometime this summer, or at least by the ARRL DCC conference in Dallas in September.

MacMapMaker will be able to support most freely available map data bases and will also be able to use GPS input for creating maps of local areas..

Currently supported or being worked on:

USGS 1:2,000,000	(the YELLOW CD)
USGS 1,100,000	(the RED CDs) (14 CDs of the US)
WDB & MWDB	World Data Bank (publicly available, CD & Internet)
DCW	Digital Chart of the World (4 CD-ROM set)
Tiger Files	US Census
USGS DEM	Digital Elevation Data (For CONTOUR Lines)
Named Location Database	(147,000 Named geographic locations in the US)

Another nice thing is that a LOT of this data is available FREE on the Internet.

(If you know of other publicly available data, please let me know, I will incorporate anything I can get my hands on...I am working on a few more than listed above, but these are the ones I will support first..)

end of forwarded message

I'm thinking more of a service like the "chat nodes" except they are fed with
APRS raw data instead of messages typed by users. Let the TNCs do the
typing, then anyone with an Internet-equipped APRS could log on and just
"listen", and even throw his/her own data into the link.

A more useful application would be to link areas on different frequencies or
too far away from each other for reliable direct links. Have a TNC on one
end retransmit all heard data to the "APRS Chat Node" and on the other end, a
TNC to pump this data out over the air.

I've only read the messages on this group for the last two months, never
made a CDROM map (only tablet digitized 2), and read the map docs. From
what I've gathered, you need the USGS DLG (Digital Line Graph) CDROM in
either 1:2mil or 1:100k in the optional format. In my experience,
experimenting with MAPFIX.BAS and other map making utilities enlightened me
far more than just reading about it :-)

I think we'd be foolish to not take advantage of the resources of the huge
computer networks out there. And why shouldn't (or can't) amateur radio
interface with other technologies??? Repeaters interface with computers and
telephones, HF rigs can do the same, and what the heck does a GPS satellite
have to do with amateur radio? - Experimentation and furthering our interests
in maintaining the right to have the hobby available to us.

Use your imagination...

Dan

I guess I am thinking that people may not want to make a Chat link and wait an hour or two with the link up to see what is happening on the other side of the link. It would be perfect if when the connection is first made the APRS system that is initiating the connection could get a blast of the current (active?) history from a file or memory on the remote (connected to) site and then save it to disk. This would allow people to surf from site to site gathering real-time info. Example: I'm driving to

Florida from DC and want a quick picture of the wx (you know, all those little blue circles that cover my route) to So. Carolina where I plan on stopping for the night. Surf to the appropriate sites, save the info then print it on your new color lazer printer to take with me. Think we can get this working by the end of the week??? :))

This would solve the problem above by putting all the wx info on MY map all the time. I like this idea the BEST! :)

Hey...loosen that shirt collar a little. If our hobby limited experimentation within the confines of "radio" I think it would be pretty boring. Amateur radio is so easily integrated into other hobbies and activities in our personal lives. In my opinion it is the other technologies and activities like APRS that keep amateur radio exciting and useful in todays technology oriented society. Take a look at the ARRL and RSGB handbooks....it's not just about "radio".

Hello everyone,

I have taken the local ILCHICGO.MAP, and made a version that has just county outlines, one that has Townships, and working on one with town names. I was wondering how do I chnage between the standard APRS map ILCHICGO.MAP and my maps which I have given slightly different names, do I need to alter the MAPLIST? These maps just look different but they are really the same size and all of the ILCHIGO one, is there a command in APRS that will allow me to type in the name of the map I want to use? or do I have to exit APRS and rename the file ILCHICGO.MAP and go back into APRS?

Ron

Sorry: I missed the question before... I must have been reading with the 'd' key again :-)

IF you connect to the USGS FTP site, and work your way down to the area of interest, you will see a number of files available. These will have .std and/or .opt file extensions. You need to grab the .opt files of interest.

NOW: We need to see if a) you have been reading those info screens of junk they put on the FTP sites telling you something that may, or may not, be inportant; or, b) the GUI FTP client you use decided for you that you don't need to read that junk at all, anyway.

Be that as it may, there was a little macro command for unix systems in the 100_K_DLG (I think) directory. The 100k files, both std and opt, are undelimited. You need to reblock the files. I've not investigated a program to do this on the PC, although I suspect I could do this pretty easily in qbasic or dBase. I just don't have time.

For the short term, if you can identify SPECIFIC files you need converted on a unix system, I suppose I can do that, although I need to find a spot I can leave the finished products for access... That ends up being a lot of data to

deadhead.

> "listen", and even throw his/her own data into the link.

1. If the radio is unattended, and if the guests are going
to transmit, they should be licenced. Otherwise, it's receive only.

2. I do something like this now. I don't want to have my DOS/Win95
box running APRS all day. I have my TNC connected to a serial
port on my SCO Unix box and just capturing data. A simple Bourne
shell script vaporizes anything that isn't from APRS. Users can
login to my Unix box's BBS, download a days worth of transmissions,
and play them back at their leisure.

3. I use the APRS terminal mode (talk to the tnc) to dial
a modem instead of the tnc, call my Unix box, use "cu"
(a unix communications program) to connect to the tnc,
and run a live APRS session (from home). This arrangement
is rather user hostile and has only been attempted by the
Unix literate.

4. Something similar could be attempted over the internet.
I haven't tried that yet.

>about the Garmin 45 for around \$200 dollars

\$300.00 The Garmin is great!

, I have access to a KPC-3 version
>6 software which has GPS capabilities? I would like to know if this is true,
>and basically what it does, cause the doc's that come with the new KPC-3 is
>the version 5 manual.

Kantronics will give you 1 upgrade free. There was a note with mine. I
bought 3 new KPC 3's in Dayton for 95 bucks each. All were the latest
firmware. I *did* have to enter the command: Interface Terminal to
get it to recognize APRS beacons, though. Then APRS could properly
initialize it.

>If I buy the Garmin 45, and have the KPC-3, do I need to build a cable?

Yes

> Where do I get the format to build this cable?

Depends on if you have 1 or 2 serial ports on your computer. Read the GPS
file in the APRS "Readme" subdirectory.

I have the layout for a Garmin to PC cable in my FTP directory:

ftp.mindspring.com/users/~rwf

> I want to run this in the car, how about an antenna? I heard a
quarterwave works, >is this true, cause
>I have an extra.

The Garmin works fine in the windshield. Or use a *short* BNC/BNC extension
cable. You can buy or make an active (preamplified) antenna as well.

I just want to know how much more money has to be invested
>to get this up and running. Does the Garmin, tell direction and speed? I
>would like to have that also, even altitude available at my drivers side.

Yes it does all that. Most of them do.

> What is the difference between the garmin 40 and 45?

40 is stripped down. Not as versatile on power sources, no removable
antenna, weird connector for external antenna, and a few other things.

I don't have a

175. BAD MAPS!!! WARNING!!!

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Wed, 10 May 1995 10:49:54 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950510103452.13607A-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

In the last few weeks, I have been using the MAKEMAPS.bas program
(written by someone else) to generate LOTS of maps from the 2,000,000 CD
ROM. The maps contain all features and result in about 30 to 40 mile
maps. It is a turn-key operation.

@\$%#\$@## BUT TODAY, I JUST HAPPENED TO FINISH THE OUTTERBANKS map and
noticed that when zooming between the USAEast map and the NCobanks map,
that the coast line was off. I then began to get this queezy feeling and
checked out the MAKEMAPS program and found that the author mapped all of
the data to the PC SCREEN aspect ratio, instead of to the real world!

So all of my recent (excellent) map work is WASTED! You may use these
maps for normal APRS net activity, since everyone is using the same map
and placing themselves on the map visually, but as soon as someone drives a
GPS through them, they are useless!

CAUTION!! DO NOT MAKE ANY MORE MAPS WITH MAKEMAPS.bas from the 2,000,000 CD.
I dont have time to dig in and fix this right away either, so if someone
else wants to look into the code please feel free. The LATITUDE appears to
be CORRECT, but the HORIZONTAL LONGITUDE seems to be expanded somewhat...
The error can be as much as 10 miles on a 64 mile map at the edges!

MAPS AFFECTED: SCeast, SCseast, SCneast, TNnorth, NCoBanks, PANwest,
GAneast, and any other maps Ive made since mid April

APR REPLY: You need to read CDROM.txt. All of the info is in there.
I am sorry that it is difficult and confusing, BUT IT IS DIFFICULT AND IT
IS CONFUSING! IT is not easy and it is time consuimg and it is a pain. I
do NOT recommend it for people who are upset by tedium, hi hi

See my recent posting today. I have just wasted 3 weeks of mapmaking
efforts when I found out that the program I was using was generating
incorrect LONGITUDES. And Im supposed to be an expert! Oh well...

Good luck...

> really the same size and all of the ILCHIGO

APR REPLY: APRS loads maps in Hierarchical order as listed in the MAPLIST. Only the LAST message in the MAPLIST that meets the loading criteria will be used. The loading criteria is that the ENTIRE existing screen range must fit within the RANGE of the map as listed in MAPLIST.

You can have TWO maps of the same area, but only the LAST one listed will EVER be loaded. BUT! You may use the MAPS-ALT command, and APRS will load the NEXT-TO-THE-LAST map that meets the criteria. This way you can have one map with all COUNTY borders on it, and one with all the roads, etc, and selectively load one or the other. This trick will NOT work for more than 2 identical maps. Why not put everything in the SAME map, and just use the MAPS-FEATURES-BORDERS command to SUPPRESS the county lines when not needed?

Greetings from a new member of this list!

Apologies if this topic has been discussed before, but could anyone advise me if they are using, or thinking of using, the handheld GPS manufactured by SILVA, better known for their orienteering compasses, etc?

I looked at these when they first came out last year, and was impressed by a couple of features (low-cost map plotter, built-in fluxgate compass) but put off by the high price in the UK.

Are they sold in the US, and can anyone let me know the price there?

180. REMOTE APRS ACCESS

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Wed, 10 May 1995 12:04:43 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950510114521.13607J-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

For the remote BBS dial-in or INTERNET access to remote APRS nets, the programming for that is FAR beyond my meager abilities. I can easily write an APRS phone line answerer, but as I noted in my previous message and has been reflected here, it will be much more effecient (less costly) if this capability is added to EXISTING BBS or INTERNET mechanisms. So here is what the APRS end of the interface will probably look like:

SIMPLE: Just look at the format of the BACKUP files. Since APRS already has the mechanism to instantly load in a file of that format, and also to SAVE one at any time, then, that will probably be the interface.

You BBS code writers and or INTERNET GURU's just tell me how you want APRS to periodically "SAVE" or WRITE out the serial port, a BACKUP file that the BBS or INTERNET box can save for its users.

Then tell me what kind of loggin "SCRIPT" is needed to fetch it, and Ill do it.

I wonder how many times Keith has to send a bulletin to this SIG about his MacMAPMAKER program. It will be available fairly soon. It WILL make maps for both the Mac version of APRS called MacAPRS and for the IBM or rather MS-DOS version called APRS.

Mac users will be able therefore to make maps in as very short period of time for either the Mac or the MS-DOS versions.

It would be OK, Bill, to make reference to either Microsoft or IBM, in that both write & sell what you are referring to here as 'DOS'.

Actually it would probably be more politically correct these days to say:
"It will be available farily soon. It will make maps for both the Mac version
of APRS, called MacAPRS, and for Intel based machines running DOS, called
APRS."

-----Begin Included Message-----

I think we'd be foolish to not take advantage of the resources of the huge computer networks out there. And why shouldn't (or can't) amateur radio interface with other technologies??? Repeaters interface with computers and telephones, HF rigs can do the same, and what the heck does a GPS satellite have to do with amateur radio? - Experimentation and furthering our interests in maintaining the right to have the hobby available to us.

Use your imagination...

-----End Included Message-----

I agree with you on most of your points but I question two basic things.

1. As I remember the the title page of this program reads "Automatic Packet Reporting System" not "Automatic Internet Reporting System". :-) I believe that the spirit of this system is and should continue to be based on radio communications systems, systems that can and are operated independantly of commercial power and/or telephone connections. Where do you turn when mother nature throws a temper tantrum, to the internet or to your radio? Bob would like to see a Nation Wide network using the same frequencies, I would like to see a system similar to the existing packet forwarding systems with HF, VHF & UHF links and gates, systems that can be operated independantly, and accessed regardless of what mother nature has to offer. (good old battery power) Lets continue to refine and expand the existing radio based systems, and networks, before we become dependant upon outside sources.

2. When was the last time you saw a GPS satellite connected to a twisted pair? :-) [would that be a random length wire antenna?]

-----Begin Included Message-----

Hey...loosen that shirt collar a little. If our hobby limited experimentation within the confines of "radio" I think it would be pretty boring. Amateur radio is so easily integrated into into other hobbies and activities in our personal lives. In my opinion it is the other technologies and activities like APRS that keep amateur radio exciting and useful in todays technology oriented society. Take a look at the ARRL and RSGB handbooks....it's not just about "radio".

-----End Includes Message-----

I agree that Experimentation is what Amateur Radio is about, it is exciting to see the ways that radio communications can and are interfaced with other technologies, after all we wouldn't be having this exchange of ideas if it weren't for other technologies. Please remember that the interfacing that APRS enjoys with other technologies (ie GPS Satellites) is a passive interface and APRS can be operated with or with out it. (I guess I am back to good old battery power, and networking and I won't beat that horse anymore) :-)

Oh by the way, It is difficult to find a shirt with a loose collar when you have an 18" neck. :-) And I do not want my money back!! ;-)

73 to all, its been fun.

When is someone going to upload APRS 6.8c to AOL. Thats the only access I have to the new files, unless I want to wait a few months for them to filter down to the local BBS's.

I think what is being left out of the conversation is the need
to first use the EXTRACT program which is only available on the
USGS CDR0M's. That puts the DLG data in a form useable by the
APRS program.
The Extract program on the CDR0M's has several needed subdirectories
that are needed and MUST follow the same subdirectory naming
convention in order to work. So if you got your dlq files over the net
from USGS you CAN'T do it.
Myself I'll what on Kieth's program that he's working on. Having seen
his work I know it will work well for an idiot like me. :-)

Bob i think there's a big bug in version 68c unless a command change is not allowing me to use it.

We are having a heavy weather warning at the present and i placed a couple of Tornado warning on the map with direction and speed of movement. But the objects placed on the map ARE NOT MOVING. I waited about 15 minutes and did not see any movement at all. PLEASE check into this as quickly as possible we count on this feature specially at this time of the year!!!.

We used 68C last night here in No Illinois with our heavy WX and it worked fine to DR storm tracks, are you using the space bar to redraw the screen?

If you are maybe your file got corrupted somehow, again it worked fine here on several types of CPU,s.

192. Rainfall problems in APRS

From: ChicagoWx@aol.com
Date: Wed, 10 May 1995 19:13:24 -0400
To: APRSSIG@tapr.org
Message-ID: <950510190801_114192604@aol.com>
Rendered body type: text/plain

Ever since APRS allowed 100th of an inch rain guages to report that amount on the aPRS network, I used it, I have a 100th of an inch rain guage. But people are telling me that its reporting strange amounts ranging from .90 to .02" even when the rain just begins. The P and R values are correct, and at the top of my screen when I do a N command, its showing a strange value for rainfall (in.) in the blue box. It looks like its not recongnizing the 3 digit R&P values vs. the 2 digit (10th inch rain reporters) Maybe Bob, you can figure this one out, cause its not simply taking the value, its multiplying it somehow, cause the readings its sending, or I should say APRS is interpreting from the data is really off. Shouldn't the value that appears in the blue box at the top center when you do a N command be the R value? Well its not.... Hope there is enough info here.

This sounds a lot like the problem I was having for a while. Check your serial interface to see if it uses high-speed UARTS with FIFO buffer, 16550.

I am running an Ultimeter with APRS and saw pretty much the same problem, though I never correlated it to saving HST files. But the frequency of failure was consistent with what you are describing. I had a two port serial card with 16450 UARTS and I picked up a dual port 16550 UART equipped serial card. I haven't had a single crash since I installed it. APRS runs for weeks at a time, and only comes down when I bring it down.

If you are using a serial card with the 16450 UARTS, it's quite possible that the com ports are being overrun when APRS has to perform disk writes to save the HST file.

Nope...not a bug, I had the same problem until I realized that later
versions of APRS have UPLINK and DEAD RECKONING in the off state at
initial startup. Change them to on and then save your cfig*.apr file and
they will be in your preferred position at next usage.

Hi aprssig,
thanks for the tip re the APRS coding stuff. I guess we're doing
it right at E0SS, even though we don't use the -11 SID. Still
seems to work fine.
Any tips on using the KPC-3 v6.0 for both aprs beacons and full
ARQ connects for telemetry downloads from an onboard uP? Seems
the single serial port on the tnc is dedicated to the GPS when
that mode's running.

Hi Bob:

I read in the docs that you could define new symbol sets. Any possibility
of a set containing standard National Weather Service wx symbols? The
cartoon-type symbols presently in use are ok, but they're a bit too big for
our SKYWARN applications. Also, severe weather watch and warning boxes are
usually drawn as such. Any chance you could modify the +/-line
option so that actual boxes are drawn (based on the same criteria, e.g. a
watch is in effect X miles either side of a line from point A to point B)?

By the way, thanks for adding the auto hbaud/vhf parameter setting for the
pk232...seems to work ok.

201. FIXED MAPS!

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Thu, 11 May 1995 10:05:02 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.950511094812.23401A-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

Yesterday I sent out a panic message, becasue I just discovered that the
MAKEMAPS.bas program (written by someone else) was generating maps
significantly stretched in the horizontal plane. Errors as much as 10 miles
were the result at the map edge.

FORTUNATELY, (big sigh of relief), I found the error. In line 65 and 66 of
MAKEMAPS.bas there are two statements that assign the X and Y values for
a point. They should BOTH be multiplied by the variable ppdy. The error
is that line 65 is multiplied by ppdx. Change that ppdx to ppdy and the
program is fixed.

NOW FIXING THE DAMAGE: After a page of transformations in working the
error backwards, I came up with a simple two line addition that you can
TEMPORARILY make to MAPFIX to let it change all the X values to the
correct offset for any maps that you may have already made with MAKEMAPS.

Insert in line 558 of MAPFIX68: FixFactor=1.37143 * cos(3.1416*LatCen/180)

Insert on end of line 560: : x%(i) = x%(i)/FixFactor

Run MAPFIX68 and load the bad map, then re-save it. Thats it! be sure NOT

to keep these two lines in your copy of MAPFIX after you have fixed all the maps.

THE MAPS THAT I HAVE MADE THAT WERE CORRUPTED ARE:

SCeast, SCseast, SCneast, NCObanks, GAneast, PAnwest, KSlwrnce, DElewes

I will be posting a file called FIXDMAPS.zip which will have the fixed MAKEMAPS program and all of these maps will be fixed.

FOR those of you that have the 2,000,000 CD ROM, this MAKEMAPS is a relatively painless way to generate 40 mile maps. But remember, that the data on the 2,000,000 CD ROM is only the major highways. Zoom into my TNnorth.map to see the typical data contained in such a map.

Rendered body type: text/plain

Hello out there I need help. I downloaded the APRSG.ZIP hoping that I could use it with a Zenith laptop, 8088. It keeps asking me where are the Maps or "can not find the Maps." How do I set up the APRS program on

a 720k disk so that it will run on the 8088. This machine has no hard drive and only two 3.5 720k floppies. It would be nice if you could give the program a path to find the map files say if they were located in the B drive on a disk. That way a person could utilize both floppy drives.

Someone please drop me a note and tell me which files I need and in what subdirectories these files belong in, all on a 720k disk. In other words how the heck do I setup the disk so the program will run. Thank you in advance.

If you have another computer on board you could read the GPS NMEA sentences in and drive the TNC directly from another serial port on the computer. I was planning to do it in this manner for our BLT-10 flight so telemetry info could be included.

Rendered body type: text/plain

I've noticed what may be a problem with the KPC-3/GPS mode.

I'm sending three NMEA sentences from a Motorola PVT6 every 5 seconds. The KPC-3 has been set to output these sentences every 20 seconds. In addition, the KPC-3 is set to send CWID once per minute. I'm also digi-peating a set of status packets thru the KPC-3 from another system immediately after I receive the GPS packets.

As the system runs it appears that on a cycle of about 5 minutes the CWID will sound slightly mistimed and the first of my two digi-peated packets will not be repeated. Shortly thereafter normal operation will resume for another 5 minutes or so.

I'm thinking that maybe when the CWID and/or digi-peated packets occur at the same time as the GPS input, the KPC-3 processor may be getting bogged down.

Does anyone have any thoughts on the matter?

Richard, w5sxd@amsat.org

My recommendation would be to disable CWID altogether, since it is not required for packet station identification in the U.S. This feature is included to comply with the identification requirements in other countries. This may not entirely correct your problem, or fix a bug if one exists, but it could help. Using CWID on packet here in the States is generally frowned upon, since it has the effect of unnecessarily cluttering the frequency.

APR REPLY: The minimum system must have the following files and directories:

APRS APRSxx.EXE
 MAPLIST.USA

 BAKS (dir)
 LOGS (dir)
 HSTS (dir)
 MAPS (dir) USA.map plus any others you might need
 README (dir)
 SYSTEM (dir) InitTAPR.TNC (or InitAEA.TNC)

You must have the MAPLIST.USA and USA.map to start with. You may then have any other MAPLISTS and MAPS. Be sure to eliminate any MAPS in the MAPLIST that you do not have in your directory, to save error beeps. There may need to be some of the other .sys files, I havent exhaustively tested to see if APRS will crash without all of them...

210. HF digital auto control approved!

Rendered body type: text/plain

HF auto-control digital approved

The FCC has released its Report and Order in PR Docket 94-59, concerning HF digital communications in the Amateur Radio Service.

The new rules, effective July 1, 1995, permit automatically controlled HF RTTY and data stations to communicate with one another in the following segments: 3.620 to 3.635; 7.100 to 7.105; 10.140 to 10.150; 14.095 to 14.0995; 14.1005 to 14.112; 18.105 to 18.110; 21.090 to 21.100; 24.925 to 24.930; and 28.120 to 28.189 MHz.

The new rules also permit manually controlled stations to initiate communication with automatically controlled HF RTTY and data stations. In this case the automatically controlled station may use any frequency authorized for such emissions, but may occupy a bandwidth of no more than 500 Hz.

Automatic control must cease upon notification by an FCC engineer in charge that the station is transmitting improperly or causing interference to other stations.

The FCC said it recognized the concerns of those who opposed the proposal on grounds that such operation could interfere with other amateurs, but that it believed the provisions adopted would be adequate to minimize such interference.

The FCC's notice of proposed rule making on this subject was released in June 1994, the Commission saying that its proposal was in response to petitions filed by the ARRL and the American Digital Radio Society (ADRS).

The FCC said that the propagation characteristics of the HF bands allow for long distance communications, presenting

"operating demands not encountered" on the VHF and higher bands. For that reason, the FCC said, it had heretofore been necessary for a human operator to "monitor the activity on the channel being used," making automatic control unfeasible.

In 1986 the Commission had authorized automatic control of amateur digital stations on the VHF and higher bands. At that time some 50 amateurs began a study of HF automatic control under FCC Special Temporary Authority, conducted by the ARRL. The ARRL's petition was then based on the results of that study. The ADRS's petition contained an additional recommendation from amateur operators who have been experimenting for several decades with digital communication on the HF bands (a recommendation the ARRL supported).

Here are the new rules, effective July 1, 1995:

97.109 Station control.

(d) When a station is being automatically controlled, the control operator need not be at the control point. Only stations specifically designated elsewhere in this Part may be automatically controlled. Automatic control must cease upon notification by an EIC [an FCC engineer in charge] that the station is transmitting improperly or causing harmful interference to other stations. Automatic control must not be resumed without prior approval of the EIC.

(e) No station may be automatically controlled while transmitting third party communications, except a station transmitting a RTTY or data emission. All messages that are retransmitted must originate at a station that is being locally or remotely controlled.

3. A new Section 97.221 is added to Subpart C to read as follows:

97.221 Automatically controlled digital station.

(a) This rule section does not apply to an auxiliary station, a beacon station, a repeater station, an earth station, a space station, or a space telecommand station.

(b) A station may be automatically controlled while transmitting a RTTY or data emission on the 6 [meter] or shorter wavelength bands and on [see HF segments, above].

(c) A station may be automatically controlled while transmitting a RTTY or data emission on any other frequency authorized for such emission types provided that:

(1) The station is responding to interrogation by a station under local or remote control; and

(2) No transmission from the automatically controlled station occupies a bandwidth of more than 500 Hz.

Rendered body type: text/plain

Well, in my last message I said that I would send out the fixed MAKEMAPS and the fixed maps in a file called FIXDMAPS.ZIP. Well, when I sat down to upload it, I realized that I had to KILL all of the existing upgrade files and APRS68c distribution files, since they had copies of the flawed maps and flawed MAKEMAPS program. So I built everything up from scratch again and the result is 68d.

There were only minor changes to the EXE:

- * Fixed 100ths rain gage readings at top of screen
- * Improved MAC symbol
- * Minor tweak to F9 centering function so that the USA map and not the WORLD map is drawn when there are stations in Calif and East coast at same time
- * Minor change to error handling routine so that you do NOT get the infinite BEEPS LOCK UP if you start APRS without the SYSTEM and MAP support files.

THE BIG CHANGE is the new copy of the MAKEMAPS program. Also included are EXE versions of a new MAPFIX and MAKEMAPS. And of course, corrected copies of the 8 affected maps. SCeast, SCseast, SCneast, NCobanks, PANwest, KSLwrnce, DElewes, GAneast.map

Sorry for the new version, but I had to kill that bad copy of MAKEMAPS. Even if you do NOT upgrade, kill MAKEMAPS.bas and EXE and those MAPS affected.

John

Sorry for the delayed answer. Am wading through nearly 400 messages that built up while we were at Dayton. Didn't give any priority to SIG messages assuming they were non-personal.

The baud rates on the TINY-2 are set by shorting block jumpers (for TNC-2 compatibility). Remove the front panel of the TINY-2 and look at the left side of the opening. The Terminal jumpers are nearest the board edge, and the radio baud rate jumpers are inboard.

The Baud command is not included in the TINY-2 firmware since it would not be functional, thus the 'no such command' type of response. The command is in the instruction manual (with a caveat that it may not apply to all models) to cover the HandiPacket, PicoPacket, TNC-320, PC-320 and other 8530 (not SIO) based controllers.

If you need any additional assistance, please contact us directly.

I have a design and the design equations for a GPS tach antenna which can be made on FR-4 board. the only problem is that the tolerancing is VERY tight. The dielectric constant doesn't vary too badly on FR-4, but if the other dimensions chnage by much more than 0.5mm in X or Y then the antenna would be off frequency. To give you some idea of the nature of the problem, the return loss curve you see on an HP8510 network analyzer for such a patch is typically only about 80-100MHz wide for acceptable values <-10dB. This is why you'll see small tuning stubs about 0.5mm in length on the outside edges of the patch on most antennas. Each antenna is placed on an ANA and tuned to the right frequency. You are dealing with an extremely high Q circuit. Tuning takes seconds, but if you haven't got an ANA or swept gain system, it'll be a nightmare to tune them. PacComm has looked at doing this for in-house purposes, but without the right test gear it's not really on.
Regards, Paul.

The question of using GPS data AND uploading/downloading data from balloons came up.
When our PicoPacket becomes available that is EXACTLY what it will do.

It'll function as a full TNC PLUS a full time GPS port too.....
and all in a much smaller package than other TNCs.
The Pico is about to go for FCC testing.... so stay tuned.
Bye. Paul.

Watch boxes are very often more than 100 miles wide...and they are
parallelograms (sp?) not rectangles. The are defined by a line between
two points on a map and the area on either side of a line....example,
today's Severe Thunderstorm Watch over northern and central Florida is
along and 60 statute miles either side of a line from 45 miles S of Cross
City, Florida (CTY) to 25 miles SE of Daytona Beach, Florida (DAB). That
makes the length of the parallelogram about 150 miles and the width 120
miles.

I like the weather symbol idea too...but it might be confusing to the
non-weather types ie the symbol for showers is a triangle over a
dot...might be confused for a tornado....

What I do is put the thunderhead on the map with direction and speed but
I use the NWS terminology to describe it...ie TRW+ for heavy

thundershower...TRWXX for severe thunderstorm...TVS for tornado....etc.

I have spoken to several NWS personnel and they too find the watch box small, even for a midwest situation in Illinois,etc.

A box with 200milesX300miles is fine around here but others need to speak up for their situations, such Florida and the shape of it.

By the way could someone give Internet Address to upload 6.8c. I looked in different FTP sits and nothing. The address would suffice.
Thanks.

Rendered body type: text/plain

I found the problem Gordon and am now running APRSG on the laptop. When you makeup your disk you have to create a directory named APRS (this can not be a root directory),and subdirectories to it named, maps, hsts, bak, system and etc. you must copy over the system files to that directory from your 68c and then any maps to the map subdirectory. You also have to rename your maplist.ca to maplist.usa like you mentioned but I find that the maplist.usa works just fine and does call up all the Calif maps.

Thanks again and the new APRSG version is cut down by 23k it does help.

I sure wish Bob would make it so that you could use both floppy drives on the old laptops that did not have a hard drive this would give us twice as much room on the system. Say when the system first boots up and you enter all your info in, callsign, tnc type, ports and etc. it could come up and ask you the path to your map files, say for instance a path of b:\maps. This way you could run your program on the A drive and then have your maps on the B drive. Maybe I will mention it to him. 73's and tks again

Rendered body type: text/plain

Thank you Bob for the information. I have another post on this thread regarding an idea for the APRSG program which if possible may give those of use with the old 8088 laptops more to work with. My suggestion would be to add a prompt at the beginning of the information section when a person first enters his/her information regarding the system they are using. This prompt would ask for a path in which the maps maybe found. In other words it would give the user the ability to use both floppy drive A and B. Lets say you have a disk with the APRS program on it in drive A, when the program prompts you for location of the maps you could type, "B:\maps" or hit enter for a default drive and director this information would be saveable for as all other info is for the registered users. This would give us poor laptop users, and I do mean poor, the capability to use both of the floppy drives and giving us more disk space to add maps or other information as it becomes available or as needed.

I don't know if it is possible Bob, I am not a programmer just someone with an idea. Thank you for everything you are doing, fantastic job keep up the great work, I wish there was some way I could help. 73's

I also have a KPC-3 (v5.1). I want to upgrade to v6.0 so I can do the GPS
thing too. But I have some questions.

How does the GPS connect? Do you make a 'Y' splitter between the radio and
the TNC? I would like more details as to how this works. I have a
Powerbook, which only has one serial port, so I want to ensure I understand
how this is going to work before I proceed with upgrading.

BTW, I have the Garmin 40, I bought the antenna and data cable. The data
cable has a four pin connector, but only 3 wires. I have no doubt about how
to connect it to the computer. I wonder how to externally power the GPS
though. Does it take power from the computer? Can it take power from the
computer? Is there a separate power cable? Can they both be used at the
same time?

I'd like to second that. I have an old Tandy Laptop where, using their
DOS version, you can easily configure 64k above the 640k RAM as a RAM drive.
Small maps could probably go there.

The GPS mode in 6.0 of the KPC firmware converts the TNC to a dedicated tracker. It takes GPS data and transmits the selected info out thru the attached radio. In GPS mode, the TNC does not do normal terminal operated functions. It is sorta like being in KISS mode. A certain procedure places the TNC back into regular packet mode.

You can remotely "log in" th the TNC from another TNC with a password. Once logged in, you can change the TNCs parameters. Probably very useful if the TNC is sitting on top of a mountain (or hill, as we have here in GA) or a bus.

The TNC to GPS cable used would not be a Y cable, since the computer is not used in this mode.

To use the GPS and a PC and APRS together, you would need two comm ports (or construct or build the Hardware Serial Port Adapter that Bob describes in the GPS Readme file). This allows APRS controlled switching between the GPS and TNC on 1 comm port. Works great, I might add!

One of the things they stripped out of the 40 when it was cloned from the 45 was the 5-40 volt power input capability. I understand there is a cigarette lighter cord or some type of Garmin cord that you are supposed to use. Never thought about robbing computer power- my laptop has little enough power as it is ! :)

Hope these answers help, Chip

In APRSSIG:1184, Brad WA6KZM wrote:

"... This prompt would ask for a path in which the maps maybe found. In other words it would give the user the ability to use both floppy drive A and

B. ... This would give us poor laptop users ... the capability to use both of the floppy drives and giving us more disk space to add maps or other information as it becomes available or as needed. ..."

As a temporary fix, could you use the JOIN command in DOS to do this?
Something like (assuming APRSG.EXE is on drive A and maps on drive B):
JOIN B: A:\APRS\MAPS

(Does your laptop's version of DOS have the JOIN command?)

What I do with my old laptop is use Stacker. I use it on my main machine all the time so it is real easy to build a stacked floppy with Stacker Anywhere on it. This give me a 1 meg floppy. I put the system and my terminal program (procomm+) on the A drive and on the stackered B drive I put the whole APRS. After pruning down the map list there is lots of room left from hst and log files.

Just a note: I recently acquired a Compaq Contura Aero 486/25, and they made a pretty big deal about their auto adapter. After more than a little judicious staring at specs and manuals, I plugged it into the cigarette lighter.

I can't charge the battery: That requires 17 volts. I can run the computer, though, just fine.

Might want to review your specs and make sure you have to go with an expensive DC adapter or a noisy inverter.

If you do have to go with the inverters, though, one of the local folks who has an EMI/EMC testing business has pronounced the Radio Shack models as clean as you're likely to find.

In a message dated 95-05-12 04:14:00 EDT, you write:

>Brad - WA6ZKM -wrote:

```
>>
>> It would be nice if you
>> could give the program a path to find the map files say if they
>> were located in the B drive on a disk. That way a person could
>> utilize both floppy drives.
>>
```

You can try using the dos command - APPEND

this enables program to open data files in specified directories
as if they were in the current directory.

The command is: append /e
 append b:\maps /x:on

Use this command before you run APRS.

You then create a MAP directory on B drive and copy your map files
into it.

I tried it out by creating a RAM Disk and moving my map files
to a sub directory on it. APRS ran without any complaints.

As for disk space... I used a program called PKLITE. This program
compresses EXE files and places a small binary loader in front of it.

The loader expands the program when you execute it. The program
occupies the same amount of memory but occupies much less disk space.

Here is a comparison of APRS68C before and after PKLITE:

APRS68C	EXE	376,392	APRS as distributed
APRS68C	EXE	193,193	APRS after PKLITE

PKLITE is written by the same one who wrote PKZIP..

I hope this helps

When running from the GPS receiver, it's the only thing connected- you
disconnect the computer and connect the kpc-3 to the gps. the upgrade is
worth the price anyway.

>
>BTW, I have the Garmin 40, I bought the antenna and data cable. The data
>cable has a four pin connector, but only 3 wires. I have no doubt about how

>same time?

don't know about the gps, but you can power the kpc-3 from the powerbook- Maxim
makes a small boost-mode switching converter that puts out +12 at up to 100ma-
the evaluation kits (max734, I think) are available directly from Maxim- you
can mount this switcher inside the kpc-3 where the 9 volt battery should sit,
and power the kpc-3 from the adb port on the powerbook. made a set of short
cables, and the kpc-3 gets held onto the powerbook with velcro. works great.

drop me a note if you'd like further details.

Message-ID: <3605@paccomm.com>
Rendered body type: text/plain

A while back I said I was comparing GPS receivers with a program I wrote which would sample position fixes from two receivers simultaneously. Well, it really proved what GPS is all about and why LORAN is still more accurate most of the time! I prefer "Spindrift" to stay on LORAN with the autopilot until the day they turn off, only then will GPS get connected in.... why?
I took identical receivers (Trimble SVee6CM2s), placed their antennas side-by-side and let them rip. The antennas were deliberately placed in a marginal spot for reception. The results were pretty staggering. At most times the receivers recovered positions several to many feet apart. This was not necessarily a weakness in the Trimble design. Comparing Garmin 45 to Trimble showed the same thing. What is shown is that no matter the power of your tracking and acquisition algorithm in the receiver, you are unlikely to hold and track the same set of satellites for significant times. Standing two different hand-held GPSs side-by-side is no measure of their accuracy or "value". Go for a receiver with the features and sensitivity you require for your task. Oh, and don't EVER trust it for navigating until the day they switch off S/A !!!! (unless you can afford the DGPS receiver). Moral of the story - if you want accuracy all the time you still need to spend between \$1000 and \$4000 on a receiver. Don't let this deter anyone - just bear it in mind.....
Regards, Paul.

I have just loaded the 6.8 to 6.8c into my computer and cannot figure out how to put a watchbox in. Tomorrow we are expecting severe wx and would like to have it figured out soon. I read the wx.txt and attempted to follow the directions. Apparently, I am being outsmarted by this program for once. When the person who answers this could just up the keystrokes and directions which would accomplish the watchbox task.

THANKS

As a counterpoint to Paul's note, I've done similar comparisons. I get good correlation between 2 Motorola VP OnCore receivers, as to satellites tracked etc. And as for navigating, I can always find the airport, providing we don't have a gap in satellite coverage. I'd not even think of flying without my Garmin GPS-55AVD or someone else's GPS. Loran is too unreliable in IFR conditions for dependability, especially in Texas where you experience a lot of P-static from ionized air in the vicinity of thunderstorms.

Rendered body type: text/plain

Hello all, I just downloaded APRS68D from the ftp.tapr.org, no problem download, it went very smooth.

Went to install the new program as I have with the 10 or so versions before it, you know pkunzip -d aprs68d c:\aprs. Well that went fine to it exploded into its nice little subdirectories and the whole works just like its predecessors. But when I tried to run it, the neat little package came up and gave me an error stating that it could not find the maps subdirectory. Now keep in mind this is about the 10th time I have done this same procedure, without any problems.

Well I went back in and looked at all the directories and subdirectories to make sure that everything was in order, and it was layed out just fine.

APRS
 HSTS
 BAKS
 MAPS
 README
 SYSTEM

and you all no the routine. So I checked the aprs directory and made sure that the maplist.usa was in there and it was. I checked the maps subdirectory to make sure it had all the maps and it does. I even replaced aprs68d.exe with aprs68c.exe and the thing works great. Do we have a problem with aprs68d.exe and is anyone else experiencing this little problem? Or is it me? Don't answer that last one please. Anyway help help and help some more, thanks in advance, I know someone out there has the answer. Bye the way I am running this on a full blown all the extras P90 with 16 megs of ram, etc etc...73's all

Brad

I made an incorrect statement regarding the swapping of the exe files
 aprs68c.exe also bombs out when swapped with aprs68d.exe and using
 the same files in the aprs directory and all subdirectories.

The error that pops up is this, "Stop in line 0 of module aprs9w at
 address 0DF2.5C12", hope this helps someone with my problem...

73's again

I think Gerry's right. I'd rather have a *little* inaccuracy all the time than
 unreliable great precision. At sea, with sparse Loran, I've gone days
 without any more than a dead reckoning position (too cloudy for sextant);
 To know where we were within a hundred yards would have been pure
 luxury. Even in a foggy harbor a hundred yards is fine if you go slow
 enough. Which you should in fog anyway. Don't we all?

Bob Kirk N3OZB

I have never used Loran but i know my Magellan GPS NAV-5000DX is as accurate as stated (If not much better). Repeated times i have taken my Magellan and placed it on top of one of the 250 or so Survey control data markers located within our county, These are cement markers with bronce plates giving the Lat/Lon. The following was taken off of one of the markers down the block from my location. Marker#9147 Lat.34:59.26.17406/Lon.86:29.59.95226 Elevation 849.816. I have the full listing of my county. Now when i placed my Magellan on top of the marker within 5 minutes my reading was nearly perfectly the same as the GPS Data marker. Like i said i did this with several markers and had pretty much the same results with all of them!
By the way i got the Global Positioning System Survey Control Data Manual and map on how to find the markers from our local county survey director. Just figured this may be some help to those that wan't to check the accuracy of their GPS.

Rendered body type: text/plain

Wow, I cant believe that 68d has already made it to the FTP site. It was only on the bbs here for one day.. Oh well...

I just saw the report from Brad Amberly about a possible problem? Lemme know ASAP.

In the mean time, I just posted 68e cuz of a small(!) problem. Turns out that the post-Dayton fix where I do NOT draw the map in any GPS mode until I get a fix has a small problem. When the fix comes in, APRS tries to plot it on the background screen (which does not yet have a map on it...) and CrashBOOM. But since the crash is on the background screen, you dont even see it! Hit return, and you are back at the DOS prompt.

So 68e is a MUST REPLACE for anyone USING GPS with 68c or d.

Sorry. I spent till midnight trying to get a trimmed down version of 68c to run the GPS on the Naval Academy boats and was getting nowhere... When I realized that it might be the scenario above, I took the rest of the day off, to fix APRS, so that I could minimize the damage and replace 68d on the BBS asap. For being there only 22 hours, looks like someone beat me to it.

So if there is a problem in the 68d posted on the ftp.tapr site like was reported by Brad Amberly, which is NOT related to the above problem, then lemme know ASAP, since its also gonna be in 68e.

Keith must be groaning by now. And I thought I was doing so well at keepipng the versions down.

Did you unzip it using the command "PKUNZIP APRS68D -D"? The -D tells the system to create the subdirectories. If the maps are in the root directory APRS will not find them.

255. Garmin-45 serial port

From: kc5ejk@onramp.net (Robert Winingham)
Date: Fri, 12 May 1995 23:27:50 -0500
To: aprssig@taprr.org
Message-ID: <v01510101abd988d8cc4f@[199.1.11.116]>
Rendered body type: text/plain

I have interfaced to my computer a Gamin-45 GPS (software version 2.32).

What is the real story about the serial output voltage. ???
I see Zero to 2.5 Volts.

I have read in the APRS-sig and APRS program notes that it is
+- 3V or that there is a level shifting device in the plug.
NOT ON MY Cable or UNIT !.

I did a quick test by placing a 2,200 ohm resistor to a (-) marking

RS-232 pin on the computer to the GPS serial output pin.
This gave -0.5 to -1.0 output when no data was being sent.
I then started receiving date. I found that just jumping the xmit
and rec pins with the resistor also seemed to work.

I have the Garmin PCX5 IBM software disk and data cable.
The Cable supplied with the software does have a small clamp on RFI choke
6 inches from the 4 pin GPS side of the cable.
The other end of the cable is a 9-pin female computer plug.

9-pin Plug-- 4 pin GPS plug
Pin 2 (Brown) - Data in
Pin 3 (White) - Data out
Pin 5 (Black) - Ground (Power and Data)
NC (Red) - Power

The colors are from the other available data cable
Garmin/45 Power/date with in-line fuse \$26.95

Someone posted that the Garmin/45 serial I/O is RS-422. I will give
that a try on my Mac and see if I can run it without a level shifter.

PCX5 runs very slow under Mac Softwindows but it does function after
making the level shift modification..

If anyone know the real I/O specification , please post.

Thanks

Bob KC5EJK Dallas -- kc5ejk@onramp.net

256. MacGPS_45 RS232 connection

To: aprssig@tapr.org
Message-ID: <v01510102abd9e300fab9@[199.1.11.116]>
Rendered body type: text/plain

Paul Ross posted this in the sci.geo.satellite-nav group

To connect the Garmin 45 to a Mac the folowing works well (at least on my
PowerBook 170).

The easiest thing is to get a printer cable which has a couple of 8 pin
mini DIN plugs on it and cut it in half. Identify each wire connection to
the relevant pin on the plug and solder the Garmin 45 cable wires as
follows:

Garmin cable colour	Signal	8 pin mini DIN
-----	-----	-----
Black	Ground	4
White	Data In	3
Brown	Data Out	5

The pins on the 8 pin mini DIN plug attached to the cable are numbered
thus when looking into the pins (sorry for the poor drawing):

Well heck I havent had a problem with the program on the laptop here but the 286 qth computer wont "play" ball. On the 286 it wont unzip but on the laptop it did both using the same unzip program. Go figure.

Also is the Wx watch "box" a true box on the screen because I havent been able to get it. Is it a Input function or a Wx function. I didnt quite understand the Wx.txt file on the what it is under in respect to building a watchbox. eg. to get a tornado to appear it goes I for input, A add obj, lat-long,object name, wx, etc... What Im asking is the keystrokes to input a watchbox.

One last thing if I wanted to post a Bulletin what are the keystrokes?
Once again thank you for all,

NOID N9RLR PEORIA

<<

The TNC to GPS cable used would not be a Y cable, since the computer is not used in this mode.

To use the GPS and a PC and APRS together, you would need two comm ports (or construct or build the Hardware Serial Port Adapter that Bob describes in the GPS Readme file). This allows APRS controlled switching between the GPS and TNC on 1 comm port. Works great, I might add!
>>

I must have missed something there. The computer is not involved but it takes two serial ports? How does the TNC get the data if the computer doesn't direct the data from serial port one to serial port two?

<<

One of the things they stripped out of the 40 when it was cloned from the 45 was the 5-40 volt power input capability. I understand there is a cigarette lighter cord or some type of Garmin cord that you are supposed to use. Never thought about robbing computer power- my laptop has little enough power as it is ! :)
>>

The Garmin 40 is still supposed to do power in, just has a narrower voltage range (which is no big deal, just make a little voltage regulator. The question still remains, how to get external power into the 40 while taking data out ...

Hello Bob,

I have been using your software for a few days now. I registered it in order to gain some experience with it for a commercial application here in the UAE. I will not use this version for the commercial job.

The simplified details of my application are that I will have one semi-fixed site. It will move about once per day. The mobiles will operate in about a 40 km area around the fixed site. Each evening the mobiles will return to the fixed site which will have moved. I only need to see if the mobiles are headed in the correct direction or not.

The features desired:
Scaleable grid.
Kilometers instead of miles.
Speed and distance of mobiles.

How difficult (expensive?) would some or all of these enhancements be?
Some might be useful even in the amateur version.

Thank you
Steve Sykes kd2om/a61aa

260. AUTOMATIC CONTROL & APRS USERS

From: AA8JK@aol.com
Date: Sat, 13 May 1995 11:59:17 -0400
To: aprssig@tapr.org
Message-ID: <950513115913_117409114@aol.com>
Rendered body type: text/plain

Now that the FCC has changed the HF rules on automatic control of a data station, I feel it may be the right time to "stake our claim" and consider some additional HF frequencies for APRS use.

So we (APRS users) are not burdened with the title of "Frequency Theifs" or "Spectrum Abusers" from non-APRS'ers (like when we started to use 145.79 Mhz), I feel we need to come up with a plan to use a group of frequencies on HF. I am looking for input from the users to come up with a plan.

The 30 meter frequency of 10.151 LSB has been working well for us. We, as users, have learned about 30 meter propagation and have worked around it, making 30 meters useful. Bob's idea of using the last available frequency on 30 for APRS is an idea that can be used on the other bands.

AUTO SEGMENT	PRESENT APRS FREQ	PROPOSED
28.120-28.189	NONE	28.190 LSB
24.925-24.930	NONE	24.931 LSB
21.090-21.100	NONE	21.101 LSB
18.105-18.110	NONE	18.111 LSB
14.095-14.0995	14.0963 USB	NO CHANGE
10.140-10.150	10.151 LSB	NO CHANGE
7.100-7.105	7.085 LSB	7.106 LSB
3.620-3.635	????????	3.636 LSB
1.800-2.000	????????	????????

Is there a SW broadcaster at 7.105????

Remember, when using lower sideband, your signal is 1.7Khz DOWN from the freq on your radio, being well within FCC requirements. (see HF.TXT in readme directory of APRS).

I am NOT putting this information out to be the APRS HF Frequency God. I would like to see some type of workable HF plan to be decided upon by the users. I feel if we do not come up with a plan, we could be "on the outside looking in". The future of APRS on HF is up to us.

As one who has run APRS from a non-North American location, I would like to see the 17 meter band used for APRS. When in Australia, 20 meters was mostly useless due to the large number of other stations on the band. 30 meters was not much better, as there are many non-ham users still in the 10.150 area. 40 meters was the worst of all from down under. Even with our location in the sunspot cycle, 17 meters and 15 meters were good bands, as many data contacts were made. When DX is common in the higher bands in a few years, 10 and 12 meters will once again be useful.

Please let me know how you feel about APRS on HF. Let's work together to come up with a plan!

Anyone on 6 meters? Where are you? 50.79 Mhz for National APRS 6 meter frequency?

73,

Steve Caesar AA8JK/VK4SID

Bob, you mentioned that APRS83d has fixed the 100th of an inch rain guage problem... Did you find a problem? I figured I was one of very few maybe using it but I was concerned with the readings being decoded by people? Does this mean anyone using 83d will get good readings, or will it show correctly in older versions? Plus, I think that the Watch boxes being easier to draw for storms would help, I do the bpx, and the box is the same size, Cannot shape it to match the watch area issued by weather service, just another person giving an opinion that maybe it would be easy to do

William,

If the file you FTPed was APRS68E.zip from the TAPR SIG site than yes it appears to be bad. As the normal APRS zip file is 1.2 to 1.4 Meg in size and this one looks to be under 100k Ill bet someone got interrupted and knocked off line during an upload. Try 66to68e.zip that one works if you unzip it properly.

I hear an awful lot of whining going on in here. There seems to be a lot of folks who don't appreciate the tremendous effort that goes into writing, debugging, and refining an application (not to mention custom data files separately created to support such an application). There have been very few of you out there to give credit where it is due.

I for one would like to applaud Bob and Keith for the terrific efforts they have put into these applications (Keith is the author of the Mac version for those who haven't figured that out). I would further like to applaud Bob for putting up with a lot of heat from the list. A lot of "too many versions", "this don't work", "I don't like how this looks", "we need this feature". I would also like to thank Keith for jumping in to help Bob, even when the question/comment/complaint had nothing to do with his specific contribution.

Thanks for the work, Bob and Keith. Thanks for the list. And thanks for the bandwidth.

Lets try to be more contructive and less destructive!

Chip Griffin - President of Thames River Apple Users Group

The PowerBook 540c at Dayton was me.. It was the Rockwell NavCard GPS. This unit outputs in BINARY mode. The Mac version of APRS does support this, but now Rockwell is supposed to have a NMEA version of the card out.

This card goes for \$399 with antenna (last time I checked on the price was a couple months ago).

> I still have the same problem, It can not find the Maps, same error
> everything. Read my previous post, this is frustration!

APR REPLY: In a subsequent message, Brad found the problem. I havent confirmed it, but here is what I suspect.

In 68D I changed the default map to MAPLIST.USA. This should make it easier to keep track of all future map lists, since you no longer will have to RENAME start-up maps to MAPLIST.APR.

The problem was that anyone starting 68d without saying APRS68d/new will end up loading their old CFG file. This old CFG file will point to MAPLIST.APR. (Which will not be there...)

This explanation should be why Brad had problems, except that, If he had downloaded 68d into his existing APRS directories, then the old copy of

MAPLIST.APR should have still been there... Brad, can you confirm that you must have downloaded 68d into a NEW directory, or somehow else, did not still have a copy of MAPLIST.APR to match your old CFGI file?

"

" So we (APRS users) are not burdened with the title of "Frequency Thiefs" or "Spectrum Abusers" from non-APRS'ers (like when we started to use 145.79 Mhz), I feel we need to come up with a plan to use a group of frequencies on HF. I am looking for input from the users to come up with a plan.

A plan is good. I don't see any need to occupy 10 HF frequencies for APRS in the US/globally. Not that PacketCluster and BBSes don't do just that. Just who is calling us "Frequency Thiefs" [sic] anyway? Locally the 1200 baud BBSes whose bulletin listings are over 70% FORSALE @ USBBS [that's right, and so the same damn stuff is on every BBS] maintain that they "have" to take experimental spectrum so they can put up more ax.25 FORSALE BBSes!! Luckily all the sysops aren't like this, and one local guy is shutting off his 1200 baud user port tomorrow morning and offering the first 9600 baud user port in the Boston area. Hooray for him, I say. The guy has withstood over 250 pieces of hate mail for his forward thinking. Every one of the people who gave him grief can hit 4 or 5 other BBSes! Good God, the APRS users are probably the most efficient!

Who knows? One day we may all be using junked analog cellphones tuned to 902 Mhz for APRS!

John

> Speed and distance of mobiles.

APR REPLY: Zoom to the 32 mile or lower scale anywhere in the USA. then select MAP-PLOTS-CAP. That will display the CAP search-and-rescue grid. That is based on a 7.5 minute grid system (about 10 km). It would be trivial to extend that grid anywhere in the world. (in fact, when I finish this msg, I'll see what it does in the E hemisphere)

KM is something I should do anyway...

Speed is automatically plotted by the LENGTH of the leader

Range and bearing from the center to any object (the current location of the cursor) is already in APRS. Use MAPS-PLOTS-RANGE command.

APR REPLY: Yes, in the top-of-screen WX display, I was not properly
parsing the additional 100th digit.

> Does this mean anyone using 83d will get good readings, or will it show
> correctly in older versions?

APR REPLY: No, the fix is for your local display. Only 68d will see the
correct display (I hope!)

> Plus, I think that the Watch boxes being easier to draw
> for storms would help, I do the bpx, and the box is the same size. Cannot
> shape it to match the watch area issued by weather service, just another
> person giving an opinion that maybe it would be easy to do

APR REPLY: THE NEW WATCH BOX FEATURE IS NOT A BOX. It is a LINE.
Select INPUT-ADD-OBJECT-AREA-LINE. Then when asked for comments for that
object, insert anywhere in the comments the half-width of the box in
miles enclosed in braces: { 30}
This will draw the center line and two dotted lines 30 miles either side
of it. Notice that the {xxx} is a 3 digit field.

Yes Bob that is exactly what I did. I did not start the program with
the APRS68d /new, I started it as I normally would and the program
came up and asked for all my info again and after entering it I entered
my val number and that was that. This is of coarse after I renamed the
.usa fill to .apr, then turned around and copied the .apr and renamed
it .usa so now I had a .usa and .apr so it would finally run. Opps on
my my part, sorry Bob and tks..

Brad

Hey John...now that's an interesting thought! Wonder how we could use
todays cellular network to augment the packet network? The discussion on
the sig last week about using the internet was interesting...but a notebook
on the move, cellular modem and free off-peak airtime in the Cell One could
be a deadly combination! I don't want to steal any of the limelight from
the amateur service but we should look into this technology as a backup.
With the cellular plan I have I get free offpeak airtime between 7PM and

7AM and all weekend long.

I probably set myself up for a big fat flame now...oh well...

73,

Tim

PS Did anyone find any surplus GPS this past weekend at Rochester?

279. Heath WX station for APRS

From: jeff.brenton@espi.com
Date: Sun, 14 May 95 22:10:00 -0500
To: aprssig@tapr.org
Message-ID: <9505142210.0V51V02@espi.com>
Rendered body type: text/plain

Since I finished "fine tuning" the broadcast strings this morning, with the help of Larry Keeran, I've already received an inquiry as to how I got a Heath weather station to work with APRS. Well, the secret is.... I didn't, really!

I have dedicated a computer at the McHenry County (IL) Emergency Operations Center to reading several sources, including the Heath Weather station, and putting that information onto the county's computer network, as well as broadcasting it in APRS-compatible form. I still need to discover how to format the rain message for the .01" resolution of the Heath, but that's not that important right now.

For those interested in doing the same, I will post the Crosstalk Mk. 4 scripts (two of them) which I use. I used Crosstalk because it has a very powerful script language available, plus it can handle talking to multiple serial ports at the same time, in a cooperative fashion. The two scripts are run as separate sessions, talking to each other as needed (mainly one way, from the Heath task to the host task, which talks to the TNC).

Eventually, I plan on expanding the host session to handle a dual-port TNC, so that we can continue have interactive stuff available on 145.03, where we normally have a KA-node, as well as APRS; what will be done is an interactive "window" will be used for keyboard input, while the script arbitrates which port data is sent to, as well as taking incoming information off the APRS channel and shuttling it off to another computer, which will likely be running APRS or MacAPRS.

Next message: two Crosstalk scripts!

Now I wish we could just get the "wonderful" folks at Road Scholar (the people who make the "City Streets for Windows" mapping program to support NMEA instead of the silly, proprietary binary format that the nav card "used" to put out.

Those people have an excellent program but are really missing the boat.

When trying to ascertain the accuracy of a GPS, gain and use data collected simultaneously for post-processing of GPS data to improve accuracy, PR trying to set a differential reference station site, and using the local "benchmarks", you need to figure out when they were surveyed, what map datum they are tied to, when they were last checked by the County, State or USGS, and whether they are still in use.

Around here, 2 cities, the county, USGS, and Texas A&M University all have reference monuments set. The A&M points, 4 city/county points, and 5 or so of the USGS points are all tied into the network. The rest are nice to know about, a challenge to recover, and may be of some use down the road, but are worthless for checking accuracy to any meaningful level for survey quality.

NOW: Most handheld GPS receivers won't display survey-grade fixes, so you may conclude you can use these benchmarks for your purposes. If you're willing to accept the limitations associated with the potential error, which may well be insignificant to you, that will work.

Me? I've a prototype differential station built and running at home. I've got a deal to trade out some RG-213/U cable repair for accurate subcentimeter surveying of 2 points at my house for the testing! The 2 nearest "reference points" are not particularly usefu to me.

Well, since I've been doing some work with some SMR and older cell radios for linking projects, I thought I might respond. Plan, simply, on using 2 radios, one as a transmitter, one as a receiver, at each site. The 45 MHz offset is gonna kill you, and I've been unsuccessful at changing that and keeping the radio functional.

Steve,

Expanding the bands used for APRS is an interesting thought, but there is also a liability - dilution of assets. If we are to use multiple HF bands then we must also consider scanning all of those frequencies and making a composite map of all users - assuming of course that one would want to track all users in the world simultaneously. But any way you look at it, coordination of APRS becomes considerably more difficult.

Hi again. I don't think Gerry Creager was really comparing like with like when talking of Avionic receivers. These are a breed apart and certainly perform better.....
Has anybody noticed a really weird thing?
I am convinced that when it rains the GPS receive is better!
I've seen this many times here in Tampa during the daily thunderstorms. Somebody of high IQ doubted this very much until a storm started and he saw the effect in front of his eyes!
I have no explanation of this because water should only be able to add path LOSS. Very strange!
Regards, Paul.

Our mail hiccupped over the weekend and I'm not sure
if you got my text writeup so here it is again:

The Clear Lake Amateur Radio Club NOSTS-2 Balloon Flight - de W5SXD

13 May 1995, Sugar Land, Texas

The Clear Lake Amateur Radio Club (CLARC) launched their second balloon in the Near Outer Space Transportation System (NOSTS) series today from Wharton, Texas, about 50 miles west of Houston.

Project leaders, John Maca, AB5SS, and Dan Feedback, KJ5MX, and others burned the midnight oil for several weeks prior to the launch preparing for a great Saturday of amateur activity. The CLARC group and many other local hams arrived in Wharton early Saturday morning after the weather was declared acceptable for a launch. Last minute tweaking and adjusting took most of the morning.

The balloon was ready to go shortly after one PM and the FAA gave launch approval for 3:30 PM. While several of the experiments had last minute problems, the GPS packet radio subsystem worked quite well, reporting the package position and allowing hams in the southeast part of Texas to use the digipeater. The GPS downlink was linked into several ground systems including APRS. Many APRS mobile units were employed, relaying through the balloon born system. Several stations used the DeLorme Map Expert package and during the recovery, and the local ATV repeater was showing street maps uplinked by John, WB5CHV, around the area in Pasadena, Texas where the balloon package landed. The local fox hunt folks and the GPS system produced good results in the recovery, locating the package within several hundred feet.

The package reached an estimated altitude of about 100,000 feet. Unfortunately, the GPS data clamped altitude at 60,000 feet, so for a while, the real position was not known. But after the balloon burst, and the altitude came back down below 60,000 feet, the GPS led the recovery team to the package. The parachute and attached package hit a power line and the package fell to the ground. A passing local resident picked up the package, put it into his van, and drove about a half mile to his house. He took the package inside his house but, since the GPS system was still operating, the recovery team located it within an hour.

The tracking system here at W5SXD worked well, reading the GPS messages from the package, calculating elevation, azimuth, and range to 12 cities in the area

and then sending status packets back through the digipeater in the package. A complete log of all this packet activity has been uploaded to various sites as NOSTS2.zip.

The GPS system consisted of a Motorola PVT6 GPS engine driving a Kantronics KPC-3. In a conversation with Tom Clark, W3IWI, it was determined that the particular PVT6 may not have had the correct version software. The version flown had a software government imposed limit of 60,000 feet. Newer software versions are said to have had this limit removed so anyone planning on flying this engine should check their version.

The Houston Balloon Launch Team led by Andy MacAllister, WASZIB, who are planning the launch of their tenth package, BLT-10, on 15 July 1995, were present at the launch in force. They enjoyed being spectators and took lots of notes that will be helpful in their flight. They are planning a similar GPS subsystem so the NOSTS-2 flight provided a good test run for tracking and recovery methods. Stay tuned ...

Subject: PVT-6 version numbers
Author: John Maca <jmaca@phoenix.phoenix.net> at INTERNET_MAIL
Date: 95-05-15 10:48

Hi Richard,

Here is the info on the PVT-6 that flew on NOSTS-2.

COPYRIGHT 1991-1992 MOTOROLA, INC.
SFTW P/N # 98-P39949M
SOFTWARE VER # 2
SOFTWARE REV # 1
SOFTWARE DATE 24 NOV 1992
MODEL # PVT601N322
..
..
MANUFACTUR DATE 330AMA854

The unit that I was going to fly (plastic case) is almost identical except the manufacture date is 304AMA168.

Please let me know what you find out.

Thanks,

John

288. APRS and DIRECTION FINDING

From: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Date: Mon, 15 May 1995 12:05:59 -0400 (EDT)
To: aprsig@tapr.org
Message-ID: <Pine.SUN.3.91.950515114601.4087F-100000@greatlakes.nadn.navy.mil>
Rendered body type: text/plain

Since the early days of APRS, I have always felt that APRS was good for 3 traditional HAM activities. Tracking, WX and DF. Apparently Tracking and WX are alive and well, but I have received 0.0 feedback that anyone is using APRS for direction finding.

It seems that APRS is ideally suited for true direction finding, and I put in everything I could think of to improve the process. But I am still waiting for feedback before I do any more. I am not complaining, just curious, why DFing has not risen to its full potential. Here are several stream-of-consciousness un related thoughts:

First, no need for EVERYONE to reply with opinions on APRS's POTENTIAL for DF, I am just interested on feedback from people who actually do DFing...

1) Is DFing truly only a competitive sport? Is group DFing not being done, simply because the tools were not there in the past, so there is NO infrastructure (or group involvement)?

2) Is there something cumbersome and incorrect in the APRS DF functions?

3) Is ANYONE using the DF interface? I have recorded about a Dozen or so DF registrations?

4) I suspect that tying all the APRS, GPS, COMPASS, and TNC into the PC is going to need some more debugging... So If you have actually hooked it all up, I need to know if it works! hi hi There are some relatively complex issues as to corralating all this data, so when someone reallly starts trying to make it work in the field, on the fly, lemme know.

5) Item 4 above may get so complex, that it will be hard to forsee all of the possible conditions, and it may just work better for the operator to do it all by the seat-of-the-pants and eyeball. Use APRS as the record keeper.

6) But despite 4 and 5, APRS should be perfect for the Sunday Afternnon ARM-CHAIR Dfer to contribute to a group localization. Then he can continue with the lawn work and let the FOX hounds move in for the kill.

So, in conclusion, I never intended APRS to be the full fledged on-the-go fully automatic DF integrator. It has the potential, and I am willing to work toward that objective, but in the meantime, APRS should have provided a two-fold multiplier in the number of stations participating in GROUP localization of a fox:

1) ANYONE can play due to the OMNI-DF and FADE-CIRCLE implementations

2) GROUP participation in a fox hunt is over and done with in the first 5 minutes of the event, leaving stations free for the rest of the day to do familiy and other things.

ANY COMMENTS?

> Bob, what happened to the DF command in ops? Can't even get it to ask me for
> my DF password.....help

APR REPLY: I hope the DF command still works..

What is different recently, is that I got rid of that irritating DF V# prompt. Just like the GPS and WX options, the extra DF V# is only needed if you connect DF HARDWARE to your other COMM port. Initially, when I first invented the FADE-CIRCLE technique, I thought it was such a powerful DF tool (but that it could also clutter everyones screens in a hurry!) that I reserved its use to only one use per user, unless the person was validated for DF. It turns out, that I still have not heard of ANYONE using APRS for DF, so I went ahead and removed that restriction, and therefore now, I do NOT need to ask for a DF number UNLESS the user wants to activate a DOPPLER DF unit on his COMM port.

Pleas confirm that the OPS-DF command DOES still work. See my next posting about DF....

DITTO from me for what it's worth... This has been a tremendous effort on the part of these folks and I salute them for doing it... I hope I can make a tiny contribution to this kind of activity sometime...

BTW, anyone seen any APRS data coming outta S Nevada - Las Vegas?
I've been monitoring .79 on 2m and haven't heard a peep... I'm almost got my bugs worked out... (that little itty bitty screw in the mic plug that holds the shell on the plug - shorted pins 1 and 7 together on TWO mic plugs !!!!!
At first I figured it was my soldering technique... but on close inspection with a jewelers loop... it's the "quality" of the plug at fault... hmmm warning for you folks out there... it ohms out ok with the shell off... but no workee when shell on... gave me fits this weekend.....)

My mail program still won't give me the original poster's address here so I really appreciate it when folks put their E-Mail address in their postings..

I hear an awful lot of whining going on in here. There seems to be a lot of folks who don't appreciate the tremendous effort that goes into writing, debugging, and refining an application (not to mention custom data files separately created to support such an application). There have been very few of you out there to give credit where it is due.

I for one would like to applaud Bob and Keith for the terrific efforts they have put into these applications (Keith is the author of the Mac version for those who haven't figured that out). I would further like to applaud Bob for putting up with a lot of heat from the list. A lot of "too many versions", "this don't work", "I don't like how this looks", "we need this feature". I would also like to thank Keith for jumping in to help Bob, even when the question/comment/complaint had nothing to do with his specific contribution.

Thanks for the work, Bob and Keith. Thanks for the list. And thanks for the bandwidth.

Lets try to be more contructive and less destructive!

In a separate message Dick sent me, a post-flight dump of the software configuration said

> SOFTWARE VER # 2
> SOFTWARE REV # 1
> SOFTWARE DATE 24 NOV 1992
> MODEL # PVT601N322

Let me expand on Dick's answer, since I know the PVT6 "ONCORE" receiver fairly well. According to Motorola's documentation and to verbal comments from Mike King (KC7PE, one of Motorola's software gurus), recent software (I believe

beginning with Ver 4.0, and explicitly specified in the Ver 5.x and 6.x Motorola documentation [the most recent version I have seen is 6.1]), the limits are determined only by the platform's velocity.

This limitation relates to the COCOM export rules which limit the sale of GPS receivers that can track high-altitude, rapidly moving platforms (the so-called "anti-scud" rule). As I recall, the mandated limits are 60,000 feet (18.3 km) and about Mach 2. Some manufacturers have chosen to enforce this limit with a logical .OR., such that the receivers change modes if the platform is moving fast OR if it is too high. In the case of the old Motorola code which was flown on this particular balloon, the receiver went into "2-D" mode, locking the altitude at 18300 meters. If the balloon went several km higher, the reported horizontal (Lat/Lon) positions were probably in error by a few km. When the satellite came back down below 18 km, the receiver resumed proper operation. Some of the small receivers (e.g. Trimble) take adopt more hard-nosed "clamp" -- the last Trimble SV-6 I tested reset itself to Sunnyvale, CA when taken above 18 km, so its horizontal positions would have been total bogosity!

Beginning about 2 years ago, Motorola decided they wanted to support the balloon world and re-interpreted the COCOM "anti-scud" rules in the same way as Collins/Rockwell. They noted that the 60kft/Mach 2 limits were specified with a logical AND. As I understand it, they chose to implement the rule by only considering the velocity limit, so these receivers can operate at any altitude providing the speed is low enough. The highest speed I have verified is below Mach 1 (in a commercial airliner), so I cannot comment on precisely what speed limit they have enforced.

Regarding the Motorola PVT6 "ONCORE" receiver, Motorola can upgrade archaic firmware if you send your receiver to them. Anyone needing this service, send me an Email message and I'll tell you the address.

73 de Tom, W3IWI

Just a quick comment regarding the speed/altitude limitations. Tom W3IWI was quite right about the different way in which manufacturers apply the criteria. In the case of Trimble we ASK if the GPS will be balloon launched and if so we order the GPS modules with the limitation backed off, namely:

Altitudes will be reported > 60,000ft if velocity is <999knots.
It's my understanding that you are NOT permitted to buy, nor are the
manufacturers allowed to sell, units which allow both conditions to
be broken. 999 knots seems to be the norm for the speed limit.
Regards, Paul.

hmm... where did you place the antenna to get good data on an airliner??
I would have thought that the geometry would have been poor at best to
get the data purely from a side facing window... did you get to place the
antenna at/near a cockpit window? Still that would be problematic... I have
my GPS antenna dorsally mounted on my aircraft and still have some problems
depending on satellite geometry.. though rarely - - the dorsal mount was
best
in tests... Did you use two antennas and some sort of an RF summing network
in the feed lines (allowing two antennas on opposite sides of aircraft)? My
curiosity gets me in trouble... maybe the GPS signal gets in through all the
windows satisfactorily... but given my experience with boats, trees, and
bldgs..
I dunno.... Thanks in advance....

MacAprs 1.5.2 is now up on the TAPR ftp server.

NOTE: You will have to re-enter some of your SETTINGS with this version. The amount of data saved in the PREFERENCES file was increased, and this causes a couple of the values to be messed up. Please check all of your preferences when you first run version 1.5.2.

The new version includes some more support for the Kantronics KAM and also some shortcuts for both Kantronics KAM and the AEA PK-900 and DSP-2232.

It will now also SPEAK bulletins that come in. Before it would only speak messages addressed to you.

Version 1.5.2 also now supports object names with SPACES in them.

This is the first release that actually has the balloon prediction in it. The documentation is being worked on for the balloon stuff, but is not finished at this time. There are several groups that are getting ready to use this so I was being pushed to get it released. In fact, I am going to Wisconsin this weekend (5/20) to use this for a balloon launch.

This version also supports the Ultimeter II data being transmitted directly over the air, and it also the Telemetry data transmitted by the MIM units that Bob has been discussing.

There will be a PowerPC version of 1.5.2 up on the server by the end of the week.

MacAPRS State Maps!!!

I have been getting several requests for the high-res state maps used in MacAPRS. There are only a couple of these included with what gets distributed simply due to the large size that 50 of these maps would add up to.

I have now started to upload these maps to the TAPR ftp site (ftp.tapr.org) they are in a separate folder called MacMaps. I have put several of these there tonight, and will continue until I get all 50 states up there. If you want a state that is NOT there, send me (NOT THE LIST) a message, and I will try to get your request done soon. I hope to have all 50 up there within a week or two. It simply takes time.

In fact, the Trimble S-Vee-Six CM2 performs better than my Garmin GPS-55AVD Aviation handheld. it's more powerful, has the ability to prefilter some of the dither, and is apparently less subject to wandering about with S/A than either the Motorola engines or the Garmin, IF the filtering is on.

What kind of antenna are you using, and how is it mounted. The only rational idea I've developed in the last few minutes is that you're getting better grounding and/or a better plane, thus seeing less multipath reflection.

Actually, you're thinking of Street Atlas USA. And, nope, it doesn't support GPS inputs. The product they have that does is MapExpert, for about \$199. Plus the GPS validation costs.

Several of us tried a couple of months ago to convince DeLorme that if they dropped the price and encouraged the ham community to partake they'd probably sell a few more. They didn't think there was any hobbyist out there doing this sort of thing. More's the pity.

> I dunno.... Thanks in advance....

In fact, I've used mine in airliners inadvertently a couple of times, and intentionally once or twice. Your choice of satellites is limited, but will usually give you a solution or so. In fact, dorsal mounting is preferred when possible.

As for a "summing" network, a Wilkenson hybrid will provide adequate signal in most cases, but has not been necessary when I've been playing. Further, a little error in coax length can really confuse signals and timing, in a spread spectrum (essentially pseudo-diversity) environment.

What type of GPS do you fly with, and what kind of aircraft?

Yep, I have a bone to pick with them too. Street Atlas USA is a great product, and giving it lat/lon display and find capability would have been a trivial matter, but it appears that used that as a carrot to get users to buy Map Expert. Map Expert looks nice but that's a little more than I care to spend for hobby software.

20 lashes! John Kerr finally isolated a problem that two others reported since 6.8a. They said that while driving around with a stand-alone-tracker, that others would report loss of tracking at random times. John correlated it with a BAD NMEA report at the top of the screen.

Sho'nuff. Once APRS detected a BAD NMEA report, it began to reject ALL FURTHER TRACKER POSITS. ARGH!

He reported the bug just hours after I posted the 68e version. SO here I am again, groveling, posting 6.9. The reason for the quick posting is to supersceed the 68 versions ASAP and to get the problem resolved before I go on my anniversary vacation. (she wont let me take a radio to the virgin islands!)

Good news! I found a better way to compile APRS and just chopped off another 32K. Version 6.9 is only 345K compared to a high of 428K a while back. That should make the APRSG(9) version down to about 310K when I get a chance to re-compile it.

Also, I just finished 8 new maps of Florida. These are from the 2,000,000 CD ROM (so they have NO new roads not already posted in the existing FLorida maps, but they do retain much more detail around the coastline, plus they have Rivers, streams, and coun4y lines not currently in the Florida maps. I tried posting them, but had a bad disk. I will post these new maps in SEmaps04.zip when I get a chance...

" 1) Is DFing truely only a competitative sport? Is group DFing not
" being done, simply because the tools were not there in the past, so there
" is NO infrastructure (or group involvement)?

We're doing it in the Boston area. Most teams and individuals are
learning about APRS, and some use it, but none for "fun"
foxhunting...yet. I have used APRS to help localize "problems", and it
works well, very well.

"

" 2) Is there something cumbersome and incorrect in the APRS DF functions?
"
Not that I've been able to tell.

" 3) Is ANYONE using the DF interface? I have recorded about a Dozen or so
" DF registrations?

Not yet, but like AT&T ads....we WILL...!

"

"
[snippage]

" 6) But despite 4 and 5, APRS should be perfect for the Sunday
" Afternoon ARM-CHAIR DFER to contribute to a group localization. Then he
" can continue with the lawn work and let the FOX hounds move in for the kill.
That's one thing I want to implement here in Boston, in a big way. We
have several guys around town with 2m/70cm beams and a little time on
their hands. I'd love to get them all turned on to APRS so that they
could contribute in a vital way to the local DF efforts. They're around
and willing to help usually, but it would be lots easier if they could
put in the data themselves, rather than having to phone them up to get
bearings. The phone-up-for-bearing method works ok _IF_ you know your
DF buddy's LAT/LONG. Then you can ADD a DF object to your map, with
bearing and quality, and it gets uplinked to the net! Just my thoughts.

Problem is, they're _NOT_ easy to work with. Even if they are plentiful, it's
a pain, so I doubt too many folks will do much with them. Even now, having
invested time and effort, I find 'em a problem to get motivated for. Over
time, I expect to make the linking apps work, but I suspect the new 1.2 GHz
repeater transverter project will be completed well before the 900 MHz link...
which is too bad, since I really need the link first.

Bob, I am VERY interested in DFing with APRS. I only see several major advantages of it.

1. Your location is automatically placed on a Map along with your DF information. This makes it easy to see all your information in one spot.
2. It becomes easy for everyone to share their information away (RF wise) from the interference (if it is a real hunt).
3. It is much easier to visualize, and much more accurate (or less prone to error) than manual map plotting.

I see several drawbacks or problems:

1. There doesn't seem to be any easy or practical way to integrate a GPS, a TNC, and a DFing device (doppler or otherwise) all into a single portable computer. At least on the Mac side of things you are probably limited to two of the above (although there are other options).
2. If you are in a competitive hunt you don't want to share your info with other hunters (so you just turn off the radio and have the tnc set to monitor its own transmissions, this works with KPC-3s anyway).
3. It is cumbersome and expensive to get an setup to be able to go mobile with this sort of setup.

Locally we have had a few 'group' hunting events. In fact, our last was one where we had people start from home. It only took two hours for them to find us, and they only took two bearings apiece. It might have gone quicker if they were using APRS and could see each other's data immediately. Or they could have had a 'net control' who entered the data for them (which they could have monitored on mobile but silent aprs system, or could have taken directions from the net control as to where to go). I am EXTREMELY interested in making this all work. Unfortunately I have YET to make the DF plotting work on any version of APRS I have tried (I am a Mac user).

PLEASE keep up the good work, and perhaps by later this week (I have Wed and Thu off) I will be able to make more specific comments and recommendations.

Thanks!

Hi Bob:

The National Weather Service has 100 weather symbols that they use. I've narrowed the list down to 17...should be enough to describe what's going on just about anywhere as far as the weather goes. I'd like to send you this list for your perusal. Most of us here in North Florida would prefer to use them rather than the current APRS symbols. What's the best way for me to send them to you...electronically or via snail mail?

Also, I just checked out the watch box feature in 68e. Have you thought any more about not truncating them at 100 miles or about making them true boxes instead of lines? Just curious. Thanks for all the work...lotsa folks around here are really impressed with APRS, including area County EOC's. Keep up the good work!

APR REPLY: Yes, there still is a limit to how far I can draw it from the original location of the DF station. But I changed it from 2 screens to at least 4 (I thought). So if the DF station is 32 miles away, then, yes, the DF bearing line will not extend 8 screens into a 4 mile scale zoomed in to the location of a fox 32 miles away. No one's beam is that accurate anyway.

For W.Nolle: Please confirm if I have at least improved it by a factor of 2 or more from what it used to be. Thanks for the report.

Lines: 10

Bob, don't forget! Lots more goes into DFing than trusting some silly
beam! Don't forget the big cpu between the ears. I regularly see
people make complex position analyses with limited data, and using APRS
and other tools, find the head-mounted processor to be pretty accurate,
but probably less repeatable than the yagi.

Message-ID: <950517073631_121663502@aol.com>
Rendered body type: text/plain

Hi,

I may have jumped the gun as purchasing a GPS but I have a couple of days to
return it, I paid just under \$299 for the Magellan GPS Navigator its called
the Trailblazer, after reading the book, I was happy to see it has NMEA 0183
output which I guess I would want for APRS... This is the Technical Notes /
Specifications

Operating Temperature: 14 to 140 Storage -40 to 167

Speed Limit: 951 MPH (1530 Kph)
Elevation limit: 57414
Time to first fix: 2 minutes or less (cold Start) 40 seconds or less

(warm Start)
after memory loss 15 minutes or more
update rate every second

And it has 3 different NMEA strings...

- a) APA, GLL, BWC, VTG
- b) RMC, RMB
- c) GLL, GGA, APB, VTG, BWC

I was wondering what these abbreviations mean, and which one would be used with a GPS ready TNC? My next question is, they sell a Data/power cable for the NMEA for about 50 dollars, do I need this, I keep seeing diagrams for cables, and was told to build one, but do I still need this cable in conjunction with building one, or does this cable they sell hook into a RS-232? I just need to know what else I need to purchase.... Also they sell a remote cable for the antenna, That I am not sure where to mount, cause they have several different versions of this remote antenna mounting stuff, magmount, but my car is all polymer, unless it goes on the hood or trunk of my Saturn. Your input on helping me understand how my GPS works, and if its a good unit, or if I should still consider another version, let me know, the accuracy seems good so far on this one. I like everything it does, so let me know if the Garmin 45 does anything that Im not getting on here... /cause again, I have a couple of days to return...
Ron

Subject: Re: More Garmin 45 Technical Info
Date: Wed, 17 May 1995 01:35:55 -0400

I have already got the "official" cable- but have been following this thread. At a recent trip to a *giant* Ham Radio convention/flea market in Dayton Ohio, I decided to try to locate this DIN connector that supposedly worked OK on the Garmin 45.

It took about 10 minutes to locate a vendor selling an 8 pin DIN socket that was designed to mount on the end of a wire (an "inline" connector). This socket had a keying slot and had several more pins than required. When the keying slot was lined up normally, 4 of the socket pins fit perfectly onto the Garmin pins. No problem with diameter or anything else. Solder four quick wires on and you have the Garmin cable.

How much more simple could it be? The socket was a dollar at the flea market and the time to solder was less than a minute. I could not locate this connector at Radio Shack, though. You might have to try a "real" :) Electronics store.

The pin layout (Sorry I am not an artist) A 7 pin socket with no center pin also works:

NMEA-0183 sentences produced by a Garmin GPS-65

If you know of differences or similarities to other Garmin models, please advise me (bennett@triumf.ca) and I will add the info to this file.

This data was collected Sat Nov 19, 1994, at about 14:54 PST (Z +8)
The boat was stationary.

The following sentences are each sent once every two seconds, except for GPR00 and GPWPL. When a route is active, GPWPL is sent once every two seconds, reporting each waypoint in the route in sequence, then GPR00 is sent once, and the sequence repeats.

Characters following the "*" are a checksum. Checksums are optional for most sentences, according to the standard. Garmin includes checksums on all sentences.

\$GPVTG,054.7,T,034.4,M,000.5,N,000.9,K*47

Course made good, 054.7 degrees True, 034.4 degrees Magnetic
Speed made good, 000.5 Knots, 000.9 Kilometers/hr

\$GPRMC,225446,A,4916.45,N,12311.12,W,000.5,054.7,191194,020.3,E*68

225446 Time of fix 22:54:46 UTC
A Navigation receiver warning A = OK, V = warning
4916.45,N Latitude 49 deg. 16.45 min North
12311.12,W Longitude 123 deg. 11.12 min West
000.5 Speed over ground, Knots
054.7 Course Made Good, True
191194 Date of fix 19 November 1994
020.3,E Magnetic variation 20.3 deg East

\$GPRMB,A,0.66,L,003,004,4917.24,N,12309.57,W,001.3,052.5,000.5,V*0B

A Data status A = OK, V = warning
0.66,L Cross-track error, steer Left to correct
003 Origin waypoint ID
004 Destination waypoint ID
4917.24,N Destination waypoint latitude 49 deg. 17.24 min. N
12309.57,W Destination waypoint longitude 123 deg. 09.57 min. W
001.3 Range to destination, nautical miles
052.5 Bearing to destination
000.5 Velocity towards destination, knots
V Arrival alarm A = arrived, V = not arrived

\$GPBWC,225444,4917.24,N,12309.57,W,051.9,T,031.6,M,001.3,N,004*29

225444 UTC time of fix 22:54:44
4917.24,N Latitude of waypoint
12309.57,W Longitude of waypoint
051.9,T Bearing to waypoint, degrees true
031.6,M Bearing to waypoint, degrees magnetic
001.3,N Distance to waypoint, Nautical miles
004 Waypoint ID
Bearing and distance are calculated along a great circle

\$GPWPL,4917.16,N,12310.64,W,003*65

4917.16,N Latitude of waypoint
12310.64,W Longitude of waypoint
003 Waypoint ID

When a route is active, this sentence is sent once for each waypoint in the route, in sequence. When all waypoints have been reported, GPR00 is sent in the next data set.

\$GPR00,MINST,CHATN,CHAT1,CHATW,CHATM,CHATE,003,004,005,006,007,,,*05

List of waypoint IDs in currently active route

(I have to do further tests to see what actually happens when navigating a route and passing a waypoint - don't know whether all route waypoints are listed, or just those still to come.)

(I assume, but haven't proved, that when navigating to a single waypoint, a WPL sentence will be sent every two seconds, without an R00 sentence)

\$GPGLL,4916.45,N,12311.12,W*71

4916.45,N Present latitude
12311.12,W Present longitude

GPXTE,A,A,0.67,L,N*6F

A General warning flag V = warning (LoranC Blink or SNR warning)
A Not used for GPS (LoranC cycle lock flag)
0.67 cross track error distance
L Steer left to correct error (or R for right)
N Distance units - Nautical miles

The following are Garmin proprietary sentences.

"P" denotes proprietary, "GRM" is Garmin's manufacturer code, and "M" or "Z" indicates the specific sentence type.

PGRMZ,93,f,3*21

93,f Altitude in feet
3 (unknown - doesn't appear to change)
This sentence shows in feet, regardless of units shown on the display.

PGRMM,NAD27 Canada*2F

Currently active horizontal datum

PSLIB,,,J*22

I don't know what this means. I think I have seen another letter, or a character in one of the empty fields, but haven't saved that data. According to the standard, it is a proprietary sentence for someone other than Garmin, but the information I have doesn't list "SLI" as a manufacturer ID.

I just posted on the 410 280-2503 BBS a map of the Seattle area. It is a 32 mile map based on the 2,000,000 CDROM data. Enter it into your MAPLIST.WES as WAsound.map,47.43,122.43,40,

If there is anyone else out there with the 2,000,000 CDROM? These maps are EASY to make with MAKEMAP.bas or EXE. Pick an area and start making em. Lemme know who's working on what, so we don't overlap. My experience is that you should NOT use the alt-SMOOTH command greater than 1.2 unless you absolutely have to. Otherwise you start cutting off smooth bends in roads. Take the 30 minutes or so that it takes to go through (with the + key) every point at about the 4000 point level, and use alt-D to delete those points that have minimum impact.

333. Question

From: "Warren E. Boudrie" <web@vectorbd.com>

Rendered body type: text/plain

Somehow while running APRS, the map format on my screen changed to a view from the air with the right hand vertical portion of the screen displaying altitudes. It's probably somewhere in the read files but I could not find the command to get that feature. I'm not sure but I think I returned to the normal map by hitting the Y key. Can someone tell me what commands I use to get and exit the altitude?

A few of us in the Rochester NY area are just getting started with APRS on VHF. Would it be correct for us to set up a single station with an alias of WIDE and for the other stations in the area to have their U path include WIDE? We have started out with everyone in the area using the default alias of RELAY and the Unproto of RELAY. Something tells me that is not correct.

Also, one of our group transmits his beacons just fine but we can not see his symbol. His symbol shows up on his own screen and he has saved it to his config file. Can someone tell me what controls the sending of the symbol or give me a clue why his does not appear at remote stations.

All the help we can get will really be appreciated.

Message-ID: <Chameleon.950517133550.wnolle@wnolle.HiWAAY.net>
Rendered body type: text/plain

Well Bob and everyone else that's interested Hi. I did some tests and even if the point of the crossbearing is only let's say 5 miles or whatever distance and you zoom in and on the cross bearing line you can see it down to the 4 mile level then it disappears at the next couple of levels BUT will re-appear at the .25 level only. Bob it does not seem to have anything to do with distance to the point of the crossbearing.

By the way guys there are some users out there that think APRS is not the thing to use for DF'ing i take it. Well imagine two or 3 users with fairly good beams and rotors, then 1 or 2 users out in the field with a GPS receiver only. You coordinate with the foxhunters on a voice repeater. Once you get a bearing fix from the people with the beams one of them places the cursor over the point where the bearing crosses, mark down the coordinance and transmit this by voice to the person with the GPS, this guy now enters this coordinance as a waypoint and just drives right to the spot within minutes. Like i said before, my stacked 13el beams can give a good and fairly accurate bearing point to within a couple of blocks at 20-25 miles. Of course after that it's up to the foxhunters to go the rest of the way. If i may say so we have some very good foxhunters in this area that for close in use nothing more then a rubber ducky and a paper clip.

Try using APRS for your next foxhunt and get some people involved.

Date: Wed, 17 May 1995 15:49:45 -0400
To: aprssid@tapr.org
Message-ID: <950517154944_122139727@aol.com>
Rendered body type: text/plain

I'm attempting to run the conv100c.bas program on an extracted hydro pull off the USGS 1:100,000 CDRM. After a moment of numerous lines scrolling thru screen the program drops and gives me this error: "Subscript out of range" on the line "origx(i) = VAL(MID\$(a\$, z+1), 12))". Name of the hydro file I'm using is H53hyf01. I did the same on H53rdf01, and the program worked OK all the way thru. The road extract file was much larger, so that's not the problem. Perhaps some APRS CDRM mapmaker can help. Regards, Dave, WH6YC, HI APRS Coordinator.

343. ACECAD Tablet for APRS Maps?

From: DDOBBINS@aol.com
Date: Wed, 17 May 1995 15:47:20 -0400

Aloha de Dave, WH6YC, on Oahu, Hawaii. We have a growing interest here on Oahu, and an excellent wide area digipeater on 145.05 that affords expanded area coverage. The digi is AH6CP-1. We will soon change to a repeater on the mountain ridge on 145.79, - offset, as the current freq is in heavy use w/BBS and ROSE traffic. I have a WX station up 24hrs on Ford Island, and a HF to VHF gateway at my home QTH in Ewa Beach, which is due west across the channel entering Pearl Harbor. We have a mix of Macs and DOS machines active, including one station on Kauai that reaches our local digi w/o problem. If you're visiting or moving to the islands, come up on freq and introduce yourself. Likewise, I'm available to answer APRS related questions at (808) 472-8452 during normal working hours. Aloha, Dave

>they
>sell a Data/power cable for t
>he NEMA

I bought the rs232 cable and use a radioshack cable made for cell phones that
has two suction cups.

On the trailblazer I've used NMEA a, b, and c with APRS and also with the GPS
aware Paccom Tiny-2 TNC straight.
NMEA A on the trailblazer is just Lat, Lon and time $GLL
NMEA B is $RMC $RMB and something else which is Lat Lon Time
Course Direction Speed and Current Waypoint Bearing to current waypoint
and cross track error; which is the distance right or left of the
parallel course to the waypoint
NMEA C is $APA $APB $GGA $GLL this is basicly autopilot stuff and does
include nuber of satelllites seen which can be handy.

```

My cousin has the Garmin 45 which has much more as far as bells and whistles but my what bells and whistles!!
On powerup you get a great circle display showing satellite posit in relation to horizon, as they are captured you get bar graph signal display, it has a position plotter that zoom in and out to diffrent scales.
The only complaint I've heard about the Garmin is the velocity doesn't keep going GARmin's capped the top spped it will display.
But heck how many folks can afford Ham Radio AND Flying?

nuff said my fingers ache from running a sledgehammer.....

350. ASCII characters on startup

Hi All,

I have had a problem with the last couple of versions that I have downloaded. It seems that every time that I boot the program and the program initializes the tnc, all I get from the tnc are ASCII characters. If I turn the tnc off and restart it then all is functioning normally and the program runs without any other problems. I am currently using ver 6.9, the problem started with 6.8a. I did not have a problem with ver6.6. My tnc is a kpc-2 and I have tried setting the program for both the kam and tapr with the same results. Any ideas why this is happening?

Thanks for the help

Don, I had the same problem, then I realized the both the upgrade 66to69.zip and the full aprs69.zip have a NEW INITTAPR.TNC file in the \SYSTEM directory. We KAM folks must change the first line of that file to read PARITY 4 not PARITY 0. All will then work and your hair will grow back.

PS: This is the first upgrade with a new INIT file in it for a LONG time, but watch for it again.

When I hook the GPS into the KPC-3, can I still access full control over the display unit so I can use the features of the GPS as I would normally without the NMEA cable hooked up? Just wanted to make sure cause I want to mount the GPS near the drivers cabin and run cables under the seat to radios. I would like to know my direction of travel, speed, Lat and Longitude at a glance while its sends the GPS data to the TNC on its own... Is this correct?

You are not the only person I have heard of with that problem. Several buddies here in Atlanta have KPC2s and the same problem. Turning it off and back on "cures" it for that session. Someone else reports it with the KAM. I have a new KPC3 and had to use the KPC command INTERFACE TERMINAL in order to activate the extra commands that APRS uses. Anyone out there know the answer to the KPC2 problem??????

No probs (I have several of the oncores) Did you make this cable?

GPS PC 9 pin (assuming you have a 9 pin PC serial port)

1	1
2	3
3	2
7	5

7 power gnd
8 power +12vdc
6 clock battery (not reqd for check out)
7 clock battery gnd

I always use this cable.

Run Motorola.bas
tell it the comm port #
tell it Yes for nmea mode
then for the sentences, type:

GGA,0001
GLL,0001
RMC,0001
GSV,0001

Disregard all the checksum junk and allthose crazy diagrams and dotted lines. That is just there to confuse you! :)

Then FTP over to my site and get the file gmday2.zip
It will give you a nice GPS display on a PC (again- assuming you are using a PC). If you have a mac, lots of luck (sorry Keith)

My ftp site is: ftp.mindspring.com/users/rwf

Let me know if you have any more problems

>It will give you a nice GPS display on a PC (again- assuming you are using a
>PC). If you have a mac, lots of luck (sorry Keith)

The Macintosh version of APRS has had FULL Motorola support in it, including the ability to get the unit OUT of binary mode and into NMEA mode, and the ability to send all of those goofy commands, all from a nice Dialog box. This has been in the Macintosh software for almost a year. (The program has only been out a little OVER a year). It then has a nice window-display showing all of the info coming from the GPS unit. This display works with ANY NMEA data. There is also support for the Magellen unit since it needs some goofy commands too.

If your unit has the GSV data sentence, MacAPRS will plot where the satellites are in references to your position in the NMEA window too. There is also a 'compass' strip that is derived from the bearing information.

Conclusion, you don't need to get any other programs to support this unit, MacAPRS does it all already..

Ron,

The NMEA output of the Trailblazer is consistant no matter what operating mode the unit is in. The only exception is in SAMPLING mode where the receiver turns on once every ten minutes until it gets a fix and then shuts down. Just be sure to enable NMEA output in the setup menu.

I do the same thing. I put the unit on the dash so I can see the display and computer in the seat. I hope to shove a PK-12 with a radio in th trunk soon.

Paul- The Oncores have an idle mode in them. Idle mode puts 'em to sleep. The self test leaves the unit in idle mode and you have to wake it up with a command in the Motorola program.

There is a new version of the Motorola program- GPS70 that is supposed to work better and also supports 8 channel units.

I have found the Oncores to be very sensitive and quick to lock. And VERY quick (3 sec) to reacquire after losing signal in trees or under a bridge.

The active antenna from Motorola makes a Garmin 45 GPS a new and amazing animal! That passive quad helix is fair, but the Moto. far outperforms it!

I'll put GPS70 on my ftp site: ftp.mindspring.com/users/rwf/

Also there are many GPS pgms and the current APRS of the day :)

By the way I am going to make it a point to stand in your booth at hamfest drawing time. Remember- I won the door prize at Tampa while absorbing good luck from you!

Message-ID: <950518163451_123534671@aol.com>
Rendered body type: text/plain

Hi All,

I did a little research with Megellan today and found out that the Trailblazer that I just purchased is the same as the Meridian, just a different color case, mine is green which is for hiking, and I guess the meridian is grey. And I also found out that there is a model XL on both the trailblazer and Meridian, which gives you sunset, sun rise, and a whole bunch of other minor features, plus plotting like the Garmin 45, I was wondering , he mentioned its about 50 dollars more for the XL models, and I know the Meridians are going for \$249, and he said there should be no price difference between the 2 models (Trailblazer and Meridian) unless its an XL then its about \$50 more, so now that I know I have the regular trailblazer, and it was \$299, I could literally switch to grey (to match my car's interior) and save \$50 from what I paid at the local store, sound correct? The only thing that he mentioned that sounded remotely interesting in the XL models was the plotting.. and I have not seen this feature, but I don't know if I would want it, maybe someone could explain what it does or how it can be used, I know on mine it will give me a compass and tell me which direction to walk

and how far, I think this is all I need, unless the plotting be useful in other means of looking at the data, I would not be interested in this feature, also the XL has 100 more waypoints for a total of 200, again not a big feature for me.

I now pose my second question, what is the pinout on the meridian/trailblazer for NMEA? I know they are the same for either model.

And where can I find the connector? Does it have a specific name? I would like to save \$48 from the manufacture... Thank you
Ron

On Thursday, May 18, ChicagoWx@aol.com asked about accessing the GPS display whilst it fed data to a KPC-3. Having used Garmin GPS's to feed moving map software for over a year, I can say that the data stream does NOT interfere with the display; they are separate functions of the GPS's computer.

You could also "Y" the data cable to the TNC, and feed a computer with a moving map, if you desired... I was going to do this for my flight to California last month, but discovered that I needed a GPS registration for APRS to make it all work.

OK! gripe time! How many of you are using the GUI FTP clients? A lot of them fail to give you all the messages and info you need when you change directories.

At one point in the directory meandering, a subdirectory banner tells you that the files are not blocked, and tells you how _ON A UNIX SYSTEM_ to unblock them. Anyone with a little more time than me can probably work thru a qbasic routine to do this. I'm a bit busy writing a DGPS translator and doing GIS for the Cows... I can't look at it.

SoAPBOX ON: This grips is not at you guys as users, but please be familiar

with the limits of your software. Several of the FTP clients don't show all the messages (?trying to protect you from excessive information?) and you never see this. What that means is, you missed vital info and had to go seeking info elsewhere. SoaPBOX off.

To a limited extent I can probably do some of this as a server, but I will need to see what space is available on one of the sites for anonymous access and retrieval.

In general, I've gotten less than stellar help from Motorola's help line, but I've found other avenues. And do, please, be careful with the GPS program as your sole source of configuration. It appears to have some interesting quirk, although recent (today) investigations suggest a number of my problems with the older PVT6 and the current incarnation OnCores have been hardware (ground-loop/differing potential ground) related rather than software. To that end, make sure that if you do not have equipotential frame grounds on the computer and GPS, that you try to isolate one or the other completely.

> P.S. DON'T EVER FEED data from a dumb modem with white noise on it
> into the RTCM port!!!!!! This kills the receiver DEAD.

Hate to be this way, but the OnCore doesn't have an RTCM port. Werre you, by chance referring to the single serial port on the box?

Hello Fred

I am also interested in local maps to use with MacAPRS. Do you know that Keith Sproul plans to release MacMapMaker in June. It will make maps from

USGS CD-ROMs. I have a 1:100,000 waterways and transportation CD-ROM that I am waiting to use. Whoops, just realized that the USGS CD-ROMs don't include Canada. Oh well, maybe there is a Canadian equivalent.

I am located 10 miles south of Port Townsend, WA.

That worked great! The problem was the cable...in the gnd ckts.
Thanks for the fast reply to my yell for help. Oh, and GM works great,
too. I wonder if the folks on the GPS usenet group are aware of it?

Actually, I received several replies offering suggestions...Thanks
everyone!

I am having a mailer problem.
I apologize if this posts more than once

Anytime, Dan- that grounding pin issue has messed up several folks here as well. Did your Oncores come from the source that was posted here, or were they from the group that was being sold at Dayton? Actually the ones from Dayton all appear to be quite an old version of firmware (no GPS Altitude > 60,000 ft) and the ones from here were all version 6.0 which was released around Nov 94 and supposedly do the altitude properly. Good thing to remember if you ever make a balloon payload! Of course that can be fixed with a flash upload from Motorola.

I have mentioned GM over on the GPS group a few times. Possibly time for another mention of it. As you know, there is a guy in Canada named Peter who has many good GPS files and programs on his FTP site. I tend to try to keep the Ham related ones on mine. His has a strange address and I have a real hard time with it.

I wonder if Bob is really down there in the VI with no radio(or TNC)? I bet he snuck one in the suitcase where she couldn't find it until it was too late :)

371. APRS in Europe

From: hschu@sunrise.e-technik.uni-ulm.de (Hermann Schumacher)
Date: Fri, 19 May 95 15:20:39 MET DST
To: aprssig@tapr.org
Message-ID: <9505191320.AA23797@sunrise.e-technik.uni-ulm.de>

Hi Netlanders,
I wonder if there are any other Europeans on this list. We (a couple of EE students and myself) have been playing around with APRS for a while now - however I get the faint impression that we are the only ones here in Europe.

A communications company will probably provide us with a number of GPS receivers in July, and I hope that will give APRS activity a boost.

So - we would like to get in touch with other European hams actively running APRS to swap ideas on what might be done here, and maybe swap maps etc. (I refined the European map and did a German one, in case anyone is interested).

73 from Ulm,
Hermann DF2DR

372. Tracking sailplane near Phoenix and Tucson (long)

From: parker@rincon.com (Mike Parker)
Date: Fri, 19 May 1995 07:44:05 -0700
To: aprssig@tapr.org
Message-ID: <199505191444.HAA20057@mailhost.primenet.com>

Rendered body type: text/plain

I will be carrying a stand-alone GPS-TNC-2 meter package aboard my sailplane during the region 9 soaring contest May 28-June 2. The short-term objectives are:

1. Try to win the contest (this has nothing to do with GPS or ham radio)
2. Develop techniques for providing automatic sailplane position reporting to ground crews (without adversely affecting item 1).
3. Demonstrate the potential to other sailplane pilots.

I am new to the use of APRS (but not to Packet or GPS applications). I welcome any comments, suggestions, or assistance.

The Region 9 soaring contest will be held at Estrella sailport 33 deg 5 minutes north, 112 deg 0 min west (30 miles south southwest of Phoenix). Visitors are welcome. Takeoffs will usually start just after noon. Contest starts will be around 1:30 and finishes 4 to 5 pm. The sailplanes will usually be flying between 4,000 and 15,000 feet ASL. Depending on the task for the day, we will usually be within 100 miles of Estrella somewhere within an arc from southeast clockwise to north. No courses will pass directly over Phoenix because of airspace restrictions. The contest is for fastest speed around a set course. You will see glides between 70 and 120 knots mixed with circling in thermals to gain altitude. Air-ground communications occur on 123.3 and 123.5 MHz (AM). They are usually short and rather cryptic however. My contest call-sign is IC (India Charlie). I am flying a Ventus sailplane in the 15 meter (wingspan) class.

I would appreciate any answers to the following questions.

1. Is transmitting on 145.79 the appropriate frequency for the Phoenix area?
2. I intend to transmit to APRS from KT7D. I am not planning to transmit to Relay or Wide because I don't know anything about relaying in the Phoenix area, and because my ground station at Estrella is blocked by the Estrella mountains from most Phoenix stations and the repeaters on the White Tank mountains. I will transmit every 30 seconds. Does this make sense?
3. Is anybody in the Phoenix-Tucson area interested in/willing to monitor the frequency and provide feedback.
4. Should I leave digipeat on? I am concerned that extensive digipeating through the glider might exhaust the handitalkie battery.
5. I will be transmitting the \$GPRMC (location, course, and speed) from my Garmin 95AVD using a PacComm Handi-packet. Altitude is contained in the \$PGRMZ message. Does anybody know how to make a Handi-packet transmit both? (there are plenty of other messages, so I can't just use \$ as the string to key on) If my PK-12 returns from repair it claims to transmit two strings. Can APRS (or anything else) currently recognize the \$PGRMZ message; if so should I change over to the PK-12 if possible and transmit both?

If anybody is wants to get more involved (say by operating a ground station, erecting a good ground station antenna, or providing/controlling a TNC-radio combination to be carried by another sailplane) please contact me at parker@rincon.com or (520) 885-2122 (home). I could really use the help. During the contest you may try calling my cellular phone (520) 449-8611 with feedback or questions. Our area code is changing, sometimes the old one (602) works better. I will not be able to talk to anyone while actually flying. This is due cockpit workload, safety, and radio configuration.

Status May 19:

The mobile unit finally worked last weekend and I (KT7D-9) was tracked by Dan Morrisson (KV7B) while driving around Tucson. An attempt to fly was defeated by high winds and equipment problems. I heard no other transmissions on 145.79 for the entire weekend, so either there isn't much activity in Tucson or it is on another frequency.

I will be on again this weekend (May 19 and 20) flying from El Tiro gliderport northwest of Tucson trying to shake the bugs out.

Mike Parker
ham callsign KT7D
sailplane callsign IC

Rendered body type: text/plain

I downloaded some map files from "edcftp.cr.usgs.gov" in the "opt" format. Some are 1:2,000,000 and some were 1:100,000. I did this via America Online's access to the Internet. From what I can tell, I need to run these files through the USGS's EXTRACT program to pull out what I need to run CONV100c.BAS and MAKEMAPS.BAS and MAPFIX68.BAS on them.

Is this correct and I looked for that EXTRACT file at the above address but couldn't find it. Am I looking in the right spot? Am I doing this right!!!

Thanks for whatever help ya'll can offer. I one of those who needs step-by-step instructions :)

I ordered two of these "jewels" back in Feb. Finally got too curious and called MFJ this morning. They claim my radios are being shipped today (two months ago it was going to be in two weeks!). I

was sorta hoping I'd hear another report before they showed up - in case I wanted to cancel the order.

Can Bill, or anyone else, give an "on air" performance report?
How about 9600 baud?

Joe Cline mentioned that he hasn't received his MFJ-8621; Amateur Electronics had several in stock when I was up there last Saturday (\$110), and R&L Electronics had several when I ordered three of them earlier this week (\$108).

I did not, however, take any of the in-stock units; Mine are "special ordered" with 145.79 and 145.03 crystals. MFJ charges the same \$24.95 extra as if you bought the crystals separately, but they will install and test them before shipping.

□ KWQ/2 1.2a □ If at first you don't succeed, put out another version (KWQ 1.2).

>area?
That is the freq suggested on my APRS copy and I have never recieved anything on it. However I just listened without any knowledge of whether there was anyone working.
I would suggest you inquire KB7K0E as he runs a packet users group in Phoenix. BBS is N7MRP. I hope this has been some help.

MFJ: Are you listening?!?!

I was planning to purchase one of these, but probably not in its current configuration.

Why not sell the radio without xtals, allowing the dealers to stock the "popular" ones. The final price could be the same once both items were bought. The dealers could determine what the active freqs were in the area. Of handle the xtals with an xtal certificate that is included. The customer mails the certificate to MFJ. MFJ drops the proper xtal (from stock) into an envelope and the user is all set to go in a few dayd.

It is strange to be forced to spend another 20% or so of the original cost of the radio to recrystal just so we can throw away the ones that we don't want (but were forced to buy).

Ralph,

re: "Why not sell the radio without xtals, allowing the dealers to stock the popular ones....."

I know I'll catch a lot of flak for this response, but I thought I'd reply from a manufacturer's point of view, even though I don't speak for MFJ in this case (and have no knowledge of their actual reasons.)

1. Dealers don't like to carry options and add-ons unless they have their own part number, box, price etc, i.e. they are a product in themselves.
2. You have to put a crystal in the radio to test it, and it has to be tuned to that frequency. For economy in testing, it makes sense to put all of the radios on the same frequency so they have an identical test procedure.
3. One faces a choice of which features to make standard and which to charge

extra for. MFJ could have priced the radio at \$145 and offered free frequency change (crystal replacement), but \$120 attracts more attention. AND some of the users will run the radio on the frequency provided and not need to pay extra.

4. More to point 3: If the radio were offered without a crystal, MFJ's cost would drop very little. Good stable, aged crystals are not cheap. However, bought in large quantity with long lead times, the price goes way down. It is that 'way down' price MFJ is paying for the crystal which is included, so if they took the extra labor to remove it and deducted the crystal's cost, the radio price wouldn't go down much.

5. Customers like to purchase 'complete' units, i.e. they want to rush home and turn it on right away to check it out and have the flush of enjoyment override the pain of paying for the purchase. Taking a radio home and turning it on, seeing it work, then taking the steps to get it on the right freq. is more satisfying (IMHO) than purchasing something that can't be tried out for 2-3 more weeks till the crystal is installed.

In general and not applying to your specific comments and suggestions: It is so easy for a hobbyist to forget the value of time. When I'm paying someone to "just drop the correct crystal in an envelope" the costs are significant. I'd estimate the handling charges would be several dollars just to do that. Purchasing time to locate, order, follow-up etc. to get the crystals. Receiving time to count, verify correctness of items. Stocking time to put them away, inventory them periodically, then get them out again one by one. Mailroom time to receive the 'crystal order' letter, date stamp it, distribute. Order fulfillment time to create a mailing label, packing slip, update the customer's record to indicate what was done. Packing and shipping time to pad the item, put it in an envelope, fill out the shipping log (so you can tell the customer when it actually went out), run the envelope through the postage meter... Customer support time to handle the customer's original phone call asking how to get a crystal (not having read the paperwork), handling the second customer call (and third?) wanting to know if/when the crystal was shipped, and the subsequent call(s) asking how to install the crystal, asking why it doesn't work right, ad infinitum.

I don't mean to sound cynical (and I'm not, most days). But I like to take the opportunity to 'tell the other side' of the story.

What is the common factor in the following statements?

- DRSI has dropped out of the amateur business.
- It is so hard to get knowledgeable telephone customer support.
- Hams go to hamfests to get good deals on equipment (may apply to mailorder too)

The common factor is that money value of time. The customer buys via mail order or at a hamfest to get a super price. That dealer (most, not all) knows he won't have to provide much support, in fact he can't because he just sells things. The customer figures he can call the factory to get all the help he needs, so he doesn't care. The factory hasn't budgeted for all that support, which is traditionally a dealer function, so he either doesn't provide it by leaving the market (DRSI) or by limiting the amount and/or quality of support people he assigns to that task.

Since I've made this rather a tirade, let me offer a few suggestions. The customer should look at a purchase of technical gear as the start of a relationship with the manufacturer. If you purchase only based on price and glossiness of advertisements, you may be purchasing an inadequate amount of customer support. In this concept of a relationship, it makes more sense for the customer to do certain things than for the manufacturer. Certainly there is no substitute for reading (yea even studying) the manuals, but things like preparing the radio end of TNC cables, installing the right crystals, etc. are more efficiently done by the customer. If he opts for convenience and speed rather than efficiency, then he should expect to pay a reasonable price for that convenience.

The new Azden D-9600 seems to be an excellent radio for 9600. It retails for \$650 or thereabouts and I wouldn't be surprised to see that go up what with the Yen now at 85 to the Dollar. MFJ has made a quite good radio for \$120. Its on one frequency, probably has little customer support burden included in the price, etc, BUT ITS ONLY \$120. How much is it fair to expect for how little?

(end flame) but it wasn't meant to be a flame....

Activity in the Phoenix area is mostly on 147.10 mhz repeater, up 600. There is some 145.79 activity from time to time. For some reason 145.79 has not caught on. If you use 147.10 mhz please set your unproto path to 'none', because on a repeater this causes less useless beaoning of your signal. This is a mountain top repeater. You will also see a BBS (Kc7y) on this frequency. Good luck on APRS

Ralph Fowler commented, "It is strange to be forced to spend another 20% or so of the original cost of the radio to recrystal just so we can throw away the ones that we don't want (but were forced to buy)."

I agree, but suspect MFJ would only lower the price about \$10 if they didn't include crystals... Partly because they STILL have to put crystals in it sometime to test it, so it would cost them to take them out afterward.

The tradition of including crystals goes back a long way, too - my Midland 13-509 came with 223.50 crystals in it, and even crystal-controlled CB radios still come with channel 14 crystals.

What I do object to, but gave into, was being charged full price for the replacement crystals, even when I will never see the "wrong" ones.

Re: Are we using the DF capabilities of APRS?

For Bob, who asked the question, and the rest of the gang here on the SIG, this incident might give some credibility to the value of APRS for DF work. In this case, during an "emergency":

Recently a local (very newly licensed) ham (N3UMJ) tentatively piped up on the local 146.61 Radio Association of Erie club repeater saying that he had just seen a marine emergency flare either over Presque Isle Bay or Lake Erie. Another ham (N8XJS) visiting the area was at the entrance to Presque Isle saying that he too had observed not one but two flares.

Being the local Deputy A.R.E.S. EC, I jumped into the conversation saying I would call the Coast Guard with the info. Could I get more details?

The first ham was driving down I-79 toward the Lake and his flare sighting was directly ahead. The second ham was at the entrance to the peninsula park at the second parking area and saw the flares in line with a large boat marina on the opposite side of the bay. This was all the info I needed!

As usual APRS was running in my shack providing local hams with gateway HF and WIDE digi service. I zoomed into the area of Erie and the Presque Isle State Park. We have highly accurate, digitized maps down to street level provided by our local map maker N3PYH, Dave.

I did a range and bearing plot for the ham driving down I-79 using the direction of I-79 as his bearing. After the bearing was determined I plotted a DF line from I-79 out over the bay. Using range and bearing from the second ham's location, I created an intersecting line on the bay waters. I placed my curser on the intersection giving me a lat/lon and called the Coast Guard.

A Coast Guard Petty Officer answered the phone and I explained that two hams had sighted flares over the bay and I had a location. I gave him the lat/lon location and he told me that there were several things going on there could he put me on hold. I waited about one minute on hold and he picked up the phone again.

He sounded very excited about our report saying the position given was within 100 yards of the location of the incident. He was literally dumbfounded with my accurate location information. Of course, it was "no problem" for me to determine a very accurate lat/lon using normal APRS operations!.

Just in case you're interested in what the incident was--several times a year the local Power Squadron holds exercises with the Coast Guard on boat safety. This was a flare use and sighting exercise for Squadron members where the boat having the "emergency" was sent to a specific location on the bay from which flares would be launched so that members of the Squadron could practice locating the vessel. We won the contest!

It's not fun, but it is, pretty much, the industry standard. Tekk does the same thing, both in the Amateur and commercial markets. I don't appreciate having to pay to recrystal the radio, BUT it means I can order crystals of known quality, from Marden or International. (I rarely bother with the others any more!)

Back in the "Good Old Days," (tm) those crystal certificates were purchased from the several crystal manufacturers. Some of the manufacturers might keep a stock, but it tended to be for the popular channels, and not for the oddball stuff.

I'd offer, too, that while setting something on-channel requires little more than a cliplead and a counter, some folks will mis-tune their radios by missing the trimmer cap and tweaking something else. I suspect MFJ wanted to take the "safe approach" and tune 'em up themselves.

Personally, I'd support the crystal certificate referenced back to the manufacturer.

On 20 May at about 1115 CST the Near Earth Space Group with the assistance of MacMaven Keith, WU2Z launched a balloon package from near Baraboo Wisconsin. Our calculations may have had a bug in them as balloon didnt seem to climb out like we thought it would, and to further confuse the issue the Motorola card quit sending GGA data at 10,000 meters. It did however continue with VTG which showed a path of due east at about 60 MPH. When we last got a "good" GGA packet it was near Horicon Wisconsin.

MacAPRS balloon predictions showed it would cross Lake Michigan near Port Washington and continue across Lake into Michigan proper. Fat chance we thought and said goodbye to the payload as we felt sure it was off to a watery end.

Guess what ? we recieved a call last night and someone found it hanging from a tree in Muskegon Michigan. Dave KA9NHL and Keith are off picking it up now.

200 miles + across open water and it just makes the shore...
is WU2Z good luck or what.....

Why all the fuss over data radios...\$120 is too much to dedicate even for me. Browsing a local flea and auction this weekend yielded an old Wilson HT for \$17, a Clegg FM27B for \$35, Motorola HT220 for \$35, a converted SSB CB on 10 for \$20 (new up and coming 10 meter beacon)...and many other goodies for cheap...all working! A few TNC's (PK80's and 88's showing up for \$40-50).

Don't limit yourself to over-the-counter buys....get out there and haggle!
It's fun!

Did you zip the original properly with the "-rp " switch? Did you unzip with the "-d" switch? Where did you unzip it to - a floppy or a hard drive?

Working yet?

Iowa State University Spacecraft Systems and Operations Laboratory
flew the latest High Altitude Balloon Experiments in Technology (HABET)
mission on 19 May. An APRS track history file has been compiled from
downloaded GPS NMEA navigation records. This file, HABET5.HST, has
been uploaded to FTP.TAPR.ORG in /tapr/SIG/aprssig/upload. It contains
almost 800 data records at 10-second intervals and makes good use of
Bob's new 3-D capabilities.

Regards, Ralph Wallio, W0RPK

Hi,
Its me, Ron. I just been speaking with a couple of people and I have a better understanding of GPS since I participated in a Balloon Launch in WI, running APRS. I have a few questions, since I want to make my Mobile operation as hidden as possible, I am starting to also consider getting a MOTOROLA CARD GPS (OEM) Okay being very stupid.. What is this Motorola card everyone is talking about? It seems very reasonable, in price, but what is it? Just a circuit board? How do you attach the antenna, where do you purchase or how easy is it to build an antenna? I have the Meridian, and still hunting for a connector for the data/power, but no luck, so I better just buy one.... Plus I am still trying to figure out how to mount a GPS antenna outside, I tried a 2m 1/4w, and nothing, so it needs to be an active antenna, but is the one that Magellan sells good? I want to put it on the trunk, magnetically. And I am going to use my HT or possibly buy a data radio, but I guess I may want to simply simplify my GPS to something small, and put in the trunk. N9LCI recommended me to look at these cards, how do they differ from the Magellan as far as quality? I am gonna keep my magellan as a portable display unit, or a 2nd tracking setup, cause I will have 2 KPC-3 v6 by June 4th. There was something about programming the card also, this sounds difficult.... Whats all involved?
Ron

The Motorola "card" I think you're refering to is the PVT-6 series of receivers, burrently called the OnCore line.

hese are 6 and 8 channel receivers that run of of 5 vDC or 12 vDC depending on which card you select.

the VP OnCore is a 5 vDc model with ttl outputs. It expects an active antenna unless you order it with the ~\$20 onboard LNA preamp. Works well. I'm in the proces of putting 20 of them literally out in a field on cows. The antenna connector is an OSX connector made by M/A-Com and sold ONLY by Penstock.

There's and XT OnCore that, if memory serves correctly is in a metal box. It is 12 vDC powered and has RS-232 levels out. Works good. Has a BNC connector on the box for output. Motorola wants a bit too much for the provelege of a metal box and BNC, tho', in my opinion.

Programming the thing to do NMEA is not hard, given the fact that thee are a number of internet sources for the Motorola GPSxx (40,70 or 90) evaluation monitoring program.

Technically, I've been very happy with the Motorola GPS engines as far as interface and capabilities. The customer support is kinda grim sometimes if you have the official eval kit and support, but the hardware is sound and they give you good solid documentation.

If you have more soecific questions, let me know.

405. Tracking Sailplanes, First Success (long)

From: parker@rincon.com (Mike Parker)
Date: Sun, 21 May 1995 21:32:44 -0700
To: aprssig@tapr.org
Cc: chip@cyber.net
Message-ID: <199505220432.VAA07924@mailhost.primenet.com>
Rendered body type: text/plain

On 6/21/95 sailplane 71 being flown by Allen Reeter in the Arizona Soaring Association Contest series was successfully tracked by Mike Parker, KT7D. The sailplane was tracked over 2/3 of the 180 mile course around El Tiro gliderport NW of Tucson. Range without digipeating was about 40 miles. Within this range, reception was very reliable.

A handi-talkie with a rubber duck antenna, PacComm handi-packet, and Garmin 95AVD GPS receiver were stuffed into a compartment just above the wings. The installation was completed using a sizable portion of a roll of 100 mph duct tape. The GPS receiver had no problem receiving through the fiberglass skin of the glider. No interference was experienced between the GPS and the 145.79 MHz transmitter even though the antennas were separated less than 1 foot.

The ground equipment was a 1/4 wave mag mount on a car roof and a GAs preamp driving

a 2 meter mobile rig, TNC, and laptop. The terrain was flat and un-obscured in the direction of flight. APRS software was used for map displays

The main technical glitch was discovery of RFI from the TNC which disappeared when its 9-pin data connector was disconnected. The RFI broke the squelch of the air-ground communications radio tuned to 123.3 MHz., and was annoying enough to cause Allen to turn the air-ground radio off for most of the flight. He noted that it seemed to get worse as the sailplane's speed increased. Testing after the flight revealed that it was definitely coming from the TNC, 123.3 MHz was one of the worst frequencies, and that it changed with GPS mode.

Allen won the "A" class this day. He felt that having everyone watching him made him more alert and enhanced his performance. Favorable comments were received from the ground crews as they watched his progress around the course. Soaring conditions were good and ground speeds at times were 130 knots between thermals.

At one point another sailplane called and asked if the tracking was working. When told yes, he said to tell his crew that he was circling in a thermal right under 71.

This is believed to be the first public demonstration of telemetering and displaying sailplane tracks.

Plans for a demonstration of sailplane tracking during the Region 9 contest near Phoenix continue. Test transmissions will begin next Sunday. Gerry Creager, N5JXS, has volunteered to supply a package for a second sailplane. If he succeeds, we will experiment with digipeating between sailplanes on some of the flying days. This should greatly extend the usable range.

Correction to my last mail, the coordinates of the Estrella sailport where the region 9 contest is to be held are:
33 deg 05 min north, 112 deg 09 min west.

Mike Parker
Ham Call, KT7D

Tim Smith mentioned the availability of much cheaper radios for APRS work, and I agree - to a point.

That point is that of standardization of stations. In my case, we're trying to standardize a package that will put a weather station on APRS in each of 20 townships in our county. I'd love for it to be more, but even getting the 20 will be a struggle.

These packages will be, as much as possible, interchangeable, so we need a source of standard radios. At first, we were going to standardize on Radio Shack HTX-202s, because they're easy to get, relatively inexpensive, and have darn good receivers. Now, it may be the MFJ, pending our tests at the EOC, where our first weather station is now on the air, and two new MFJs are due "real soon now".

For years, we've been having to make due with hand-me-downs and what we could get donated; the MFJ's will be the first *new* amateur radios in our RACES division in over a decade (has it REALLY been that long since I joined!?!).

Rendered body type: text/plain

While running our local APRS there was a station WA4KBD which is running a HF gate. I asked him if there was any objection to us beaconing our position through his gate to HF. I was rather upset with his answer in that he told me that Bob Bruninga made a statement that it would clutter up the HF map too much. Well first I would like to find out if in fact this statement was actually made. Because if this is the case then it's only fair that this works both ways. I started my computer this morning and had 3 screens full of APRS users, this makes about 48. Of course most of those were HF stations. Now we never complained about the HF stations cluttering up our map. What good is it to us VHF users to see the HF stations interfering with our operation if it's just to show us that they are there?. I can already see the problem trying to sell Skywarn on this idea which by the way is what we are trying to do (Use APRS for heavy weather conditions like all the tornados we just had here in North Alabama and Tennessee). I can't really believe this statement was made. If so I for one am going to give up APRS even though I have been working hard to get it organized here, and we are finally making headway. I have been using APRS since its inception and have several stations set up of which one is a WX station and another is a wide area digi that carries my call. I don't mind telling you that this really has me upset. To have Wide area HF digi's springing up in our area that are useless to us is just not going to cut it.

Hello All,

I've been watching this listserve for quite a while and finally decided I'd try and hookup the GPS my PB-145 (I've used the TNC input in the past but am now attempting GPS to Mac)

I have a Garmin GPS-75 and wired the data out to the Mac DIN pin 5 (should be data In). I'm totally unfamiliar with protocol between the two. I see various setups in the MacAPRS GPS setup file but it looks like they deal with Motorola & Magellan only. I see little from Garmin to point me in the right direction. Has anyone attempted GPS-75 to MacAPRS ? I could use the help.

Additionally, I intend to use an existing PK-88 for the TNC. Am I in trouble with this TNC for APRS?

I do RF a whole lot better than software and the RF is done. All I need now is a software expert to talk to.

Thanks in Advance!!

I am a "new user" of APRS 6.8. using a KAM +. I have only a HF station. When I try to change my unproto path from "none" to "gate, wide" which seems common on 10.151, I get a warning message about using gateways to link from VHF to HF. I have not been on VHF since I sold my Heathkit "Twoer" thirty years ago but seem to be doing something wrong. Any suggestions ??
Thanks, Steve AC6DR

Barry-

When you pack it, you must use the -rp switch to embed the subdirectories...if you got a zipped copy off the BBS then this is probably not your problem.

Do you have the following subdirectories present?

HSTS all files *.hst
LOGS all files *.log
MAPS all files *.maps
BAKS all files *.bak
SYSTEM all files *.sys and all the TNC setup files (resore.tnc and a couple TNC INIT files)

Does it unzip and run properly on your PC? How about manually moving the files to their proper location based on the PC model??

Lastly, it's possible you downloaded a corrupt version...download again?

Let me know-

Dan

Thanks Gerry...I am going to retrieve GPS90 from you later today...I seem to
have all the bugs figured out. It was my inexperience that caused most of the
problems...the unit works fine.

I'll let you know how it goes!

To: aprssig@tapr.org, gerry@cs.tamu.edu

>by the way is what we are trying to do (Use APRS for heavy weather
>conditions like all the tornados we just had here in North Alabama
>and Tennessee). I can't really believe this statement was made.

Why can't APRS Skywarn and APRS HF nets
work in your area? They work everywhere else.

I would welcome WX reports from stations on HF.
I would find these reports from outside my area a
great resource, as a VHF APRS SKYWARN net
has it's limits.

> If so i for one am going to give up APRS even though i have been
>working hard to get it organized here, and we are finally making
>headway. I have been using APRS since it's inception and have
>several stations setup of wich one is a WX station and another is
>a wide area digi that carry's my call.

If you have been a user of APRS since the start, you
have seen many changes in the program. What changes
have you made? APRS, packet and ham radio in general
are made up of many different ideas and opinions. Have
you put yourself in the other guy's shoes? What if his idea
of an APRS net in your area is to keep up-to-date with his
friend who is in a RV going across the USA. Another user
that has different ideas other than your's may feel YOU are
the problem! How many packets do your two stations put
out in an hour?

> I don't mind telling you
>that this really has me upset. To have Wide area HF digi's springing
>up in our area that are useless to us is just not going to cut it.

>-----<< Bill KE4EER >>-----

Most folks would not flame a new user just because
he is following the ideas found in the doc files of APRS.
What guide did you use when you started in APRS?

Many of the people on this APRS SIG have gone
through the same problems you have gone through,
or will face in the future of your area's APRS network.
As ham's, our whole hobby is built on communication.
Why don't you set up an APRS user group in your area.
If there was an outlet for problems and future plans, there
could be some order in your area. Many people in your area
may not have any idea what type of APRS station is needed
in your area.

Without some help and education from APRS elmers, many
new APRS'ers give up on APRS. What can YOU do to better
educate the APRS'ers in your area? How many club meetings
have you done an APRS demo? Have you done demo's for
clubs, other then your own? Did you make it to Dayton for the APRS
forums, TAPR dinner or the APRS EYEBALL so you could be a
better, more educated user?

We on the APRS SIG would like to be a help with APRS users.
More and more, I see people on the SIG with problems, that
in most part, are local communication related problems. Bill, I
feel you just need to work on getting an APRS group together
in your area. There are very few hams that can build an APRS
network without the help of others.

With a positive role model in your area, you can work towards
an APRS network that fits the needs of all users.

73,

Steve Caesar AA8JK/VK4SID

Message-ID: <199505221731.MAA06451@dingus.n5lyt.datarace.com>
Rendered body type: text/plain

MAPTACH Demo

MAPTECH.ZIP, 956,160 bytes, has been uploaded to ftp.tapr.org and is in:

tapr/SIG/aprssig/upload

This demo is normally provided FREE on a floppy disk by:

RESOLUTION MAPPING, INC.
35 Hartwell Avenue
Lexington, MA 02173 USA
PHONE (617) 860-0430
FAX (617) 860-0505

It is being made available to demonstrate to APRS DOS users that good mapping technology is not limited just to MacAPRS users. While Maptech is a commercially available product, this is a FREE demo of that product.

THIS DEMO IS NOT A COMMERCIAL PRODUCT

To install and execute the demo follow these 6 steps.

1. Download the MAPTECH.ZIP file.
2. Use PKUNZIP to recover the 6 files it contains.
3. Copy all 6 files to a blank floppy. (The program was originally shipped on a 3.5" 1.4MB floppy, and still likes to do it's thing from a floppy.)
4. Execute INSTALL.EXE from A: or B:.
5. If all went well, the install procedure should have created a directory called MAPDEMO on the drive you specified and will contain 36 files.
6. Execute the Maptech demo by changing to the MAPDEMO directory using the 'CD\MAPDEMO' command. Then issue the command 'DEMO'.

424. TRIMBLE GPS Unit

This past weekend I finally got around to trying to hook up my TRIMBLE Aviation Handheld GPS unit to APRS.... Well no workee (Trimble to HSP to KAM3 to Notebook - Toshiba).... so I hooked the Trimble to the Notebook and saw two kinds of messages... seeing all the postings here I reprogrammed the Trimble to just spit out RMC messages... I verified the GPS unit was spitting out just RMS msgs... then hooked things back up again.. still no workee.... since I don't see any "troubleshooting" documentation (no complaints on my part by the way.. I still think Bob B has done a great service in developing this software) what advice can I solicit from you folks about getting further along in finding out why I can't get my software to plot?? Also, I'm kinda confused (nothing new...) but I'm still in the "gee I'm curious mode"... do I still have to send in a pmnt just to see just my position plotted on the screen map? The software I'm running is that which came with the KAM-3 a month ago.. so it's not the latest.. but still it must have worked... I thought I read somewhere where I could just hook the GPS to APRS - not using a TNC.... but can't seem to find any instructions for this dummy to do just that.... HELP....

THanks in Advance

Rendered body type: text/plain

Having seen the following line in a couple of postings I just had to comment

" KWQ/2 1.2a "640K ought to be enough for anybody." - Bill Gates, 1981"

Actually it was an IBM decision by the original PC group... and the architecture was really only intended to support the lower 512KB... the way the hardware progressed decoding wise gave 128KB more so that's part of it.... and 10 times 64K (the original large memory option) was also at 64KB. Ergo... they (IBM) allowed for a factor of ten in memory growth... from the perspective of the time that was real good.... forward thinking... now - in retrospect - a significant limit. Even more limiting is the segmentation architecture INTEL has forced upon us as a legacy.... these 64KB memory segments are a legacy of the 8008-8080 hardware... the intent being a "smooth" transition from 8080 code to the 8086 family.... Tis all a shame... Motorola and National and Zilog all had flat memory architecture chips available at the time - - and the Motorola and National parts were intended to be growth parts with 32 bits in mind from the beginning..... far in advance of what the INTEL X86 architecture gave us at that time.... BTW... We're still running 16 bit code due to Gates... not unless you are running NT (not even Windows 95 is full 32 bit enabled) are you really on the 32 bit bandwagon with INTEL architecture parts - - despite support in the hardware since 386..... this 32 bit stuff is just starting while the newer RISC parts available are 64 bit implementations (SPARC, MIPS, PPC)..... I have to admit though... doggone few problems are in need of a 64 bit solution.... sure makes string compare's go fast... as well as data movement.... as Gordon Bell always said.... computer architectures keep coming back to the same issues - - and very similar solutions....

So what has this to do with APRS.. nothing I guess.... sorry but I'm in a good mood as my APRS feed has started back up again.....

All the TAPR lists keep a counter of messages that have problems getting delivered....when that limit is hit, users are put on postponed. That was something we worked out with the location that is providing us access. So, if your system has any problems during a short period (for APRS SIG especially) then you get postponed. I believe that the level is set to 5 messages currently. For APRS SIG, this could mean that you have system problems (network problems) for 1 day.

I'll check further and get it bumped up for this group...but this limiter helps TAPR.ORG reduce the amount of return mail to the site we are on...trying to be firendly.

Cheers - Greg, WD5IVD

To: aprssig@tapr.org
Message-ID: <Chameleon.950522144233.wno1le@wno1le.HiWAAY.net>
Rendered body type: text/plain

Bob, you need to know the following information what i believe to be a major bug in release 69. Bob i believe you have made some changes as to the DF bearing line. Well when i do the following i get tossed back to DOS.

>From my QTH i enter a bearing of 188 degree, signal value=8. Then i move to a location 28 miles down from my qth (Which in my case would be the TN River bridge), and zoom into this area down to the .125 mile area i get the following message!, then get tossed out to DOS.

OOPS! ERR number 6
Wyandotte

RNG .5 MILES
LM,PM:0 0
A,I,J,K,FDx.LDx:-1 0 1 66 0 0
X,Y,X1,Y1-9551,264 -7880,344 -9551,264 -7880,344
A\$ Q
C\$
ES\$ IN DRWUNIT

Hit Enter to return to DOS.

This of course makes this version unexeptable for DF'ing Hi.. Now the strange thing is, it will not do this unless there is a DF bearing line on the screen. Another thing that may help is that i had another user place the bearing on the map for me (From the same point at my QTH), i then zoomed in and it again dumped me to DOS, yet without a DF bearing line everything is fine.

Barry your confusing the heck out of the poor boy, he could care less about the packing the darn program by using the -rp switch that only keeps all directories and subdirectories intact when zipping the darn thing. He does not wish to zip it but unzip it and he did use the -d. Why not just tell him that when he starts up aprs69 to use the following command at the dos prompt, type; aprs69 /new that will do it for you 73's and good luck.

Brad

I just about gave up trying to build my own cable for my Meridian, I cannot locate anything close to the connector used for the NMEA output, checked at Hamfest and stores... Looking at what Magellan charges is the same as some of these marine stores. So I was wondering, I would like to get everything at once, It looks like they offer the POWER/DATA CABLE w/CIG ADAPTOR for \$46. I see no problem with that, but how do I want to mount the antenna off the unit outside, what are my options, I get semi good readings in the front window, I see they sell a suction cup for the stubby antenna that comes off the unit, I would like something on the trunk, maybe that connects to NMO or a mag mount or something.. They offer a magnetic mount for external antenna for \$60 (I think its kinda high) and then I don't think it comes with coaz, cause it says 6' coaz cable is \$30, this seems expensive, I want to run Mobile APRS through a TNC with the display up front my me. They offer the mounting kit for \$87 which comes with cable, bracket, and suction cup and 6' cable, this is a good buy concidering buying everything seperate, but don't know if I am gonna use bracket, have to see it first, don't really want to go with suction cup either, want a fairly permanent installation, but no drilling holes for the GPS antenna, now the data radio, I may. I really like the idea of the magnet mount, but does this use the little antenna on the meridian (BNC type) or is it a better antenna? I just see this costing about \$100 more then I wanted. Does the power/data cable have a RS 232 on it?

Chicagowx@aol.com asks about GPS antennas - I have an aircraft antenna (passive, because the Garmin 55AVD I own doesn't use an active antenna) glued to the roof of my Cherokee, but have run GPS quite successfully with a dash-mounted antenna. Many GPS receivers have quite small antennas, which can be wedged up at the base of the windshield, where they're protected from the weather, close to the receiver, and relatively unobtrusive.

The off-line reader I'm trying out, KWQ for 05/2, is the source of the tag lines sadowskp@usafcrqs.nellis.af.mil was refering to. I'm trying to force a different one on it here; hope it works.

I started in computers 20 years ago, when my high school leased a 8K DEC PDP-8E, with two terminals. Learned BASIC and machine language programming, including multiuser stuff, on that beast, so I *know* how to squeeze a lot of code into a tiny place... something a lot of programmers started to forget when 640K became available to play with! Imagine - two users in less memory than a monochrome video card...

Ah, the simpler days, when people were HAPPY to see their output clank out on the 10 character-per-second Teletype (tm) terminals, blazing along on a 110 baud connection from the computer, saving and restoring programs and data from PAPER TAPE (still have some of mine...)!

□ KWQ/2 1.2a □ This is not a tag line - it's far too short!

Couple o' things...

1. 05/2 _is_ implementing 32-bit ops. Now. Without Windoze 98 or the overhead of NT.
2. NT was designed as server software and not intended for individual workstations. The fact that it crashes less than Windoze 3.1x (and by inference, Windoze 99) just made it that much more attractive to the folks who already had the installed base and "trained" users, and hardware to support it.
3. Most folks do not realize that the Motorola hardware would have made a dandy PC when IBM selected the lower cost, cheaper-OS option of Intel. I've lamented to loss of a flat memory model for years and years.
4. As to what it has to do with APRS, Qbasic has some serious limitations. Bob's done great with the tool, but I'm hoping I can nudge him toward a programming language, rather than an interpreter with delusions of reality.

:~) I think, if we work on it, recast a lot of the code in C and assembly, and keep those portions really needed in a form of basic such as Visual Basic, that we can see some improvements in memory management, points supported, speed and comm interrupt handling.

THIS IS NO SLAM AT BOB. You work with the tools available and go on from there.

73 all,
Gerry

Ron,
Before I got the kit from Magellan, I simply used two push-on terminal
sockets with small shrink around them to connect to the data out/gnd
pins. The kit cable came with bare wires, I had to add the lighter plug
and a connector for data. The data out, at least for my model, only
swings between 0-5 volts, and was unreliable on my Mac until I added a
bias resistor between TXD and RXD on the cable so the signal would go
slightly negative. I used a 3k resistor. Trouble is, their harness adds
a lot of clutter, what with the box and cables and my spliced-in stuff.
Ahhh, for GPS/TNC/TX/RX/dual mode antenna/diplexer-on-a chip... ;^)

I have used my Meridian for about 4 months now with great success.
My attempt to make my own cable was OK.. but I finally did give up and buy
the factory cable with the 12V converter/regulator. The unit is very picky
about the 5 volt dc in. It would not work if the voltage varied more the about
.15 volt.

I bought the accessory KIT.

Please save your time and "gray hair" and get the "factory" cable. You will
be very happy then.
I mount my antenna on the dash and it works fine through the windshield.
Please contact me if you need any more info!

>Atlas USA" form DeLORME MAPPING with APRS.

Delorme has a LOT of money and time invested in their data bases, they are
not about to release that stuff to anyone.. It is also highly unlikely that
anyone could easily figure out their data format.. Due to all of this, I

seriously doubt if we could take advantage of their data..

To: aprssig@tapr.org
Message-ID: <950523203457_10070060@aol.com>
Rendered body type: text/plain

I am new to APRS and could use some help getting it running correctly. I run a command & control Comm van for the Pierce County Sheriff's department. We are used primarily in Search & Rescue and I was hoping to use APRS to track teams in the field, 4X4 and other command vehicles.

I have two other ham's helping me test APRS and one BBS. The BBS has added his lat-long to his mail beacon and I have even been able to receive it once. (Don't know how and haven't painted it since) Myself and one of the ham's are using a AEA PK-12 for the TNC and we are not having much luck. The other ham is using AEA PK-232 and he seems to have no problem picking up my position or the BBS's.

I am pretty sure this has something to do with the PK-12 setup but I haven't been able to figure it out yet. If anyone has any ideas please let me know.

Thanks alot,
Sam Roe (KB7QQQ@WA7NTF.#WWA.WA.USA.NOAM)
SDRoe@aol.com

PS. I have tried APRS Versions 6.6, 6.7, 6.8c & 6.9

Chuck & Dick,
Thank you for your input on the Magellan accesories, I am waiting for the Data cable, and will pop on either a cigarette lighter or some more reliable connector, and the RS-232 for the TNC connections. I may either rty for the antenna, using the windshield, with a extension coax or a magmount with right angle BNC and tape that real good, but I prefer the Windshield as its more out of the weather, will see what is more reliable. Thanks again.

456. KPC-3 v.6 Mobile Setup

From: RonN9QGS@aol.com
Date: Wed, 24 May 1995 00:00:41 -0400

Message-ID: <950524000039_9936060@aol.com>
Rendered body type: text/plain

Hi,
I woule like to make my installation for Mobile APRS Tracking simple as can be, I already know I am gonna use the KPC 3 with my Magellan and a HT, but what commands do I want to get familiar with and have set to certain parameters. I know if I set everything the way my TNC is set now (v5 firmware) its not gonna work, there are probably additional commands, that tells it it is a GPS, and how often to Beacon, what is a normal time for Mobil operation, 5 minutes? Does it report speed and course? Cause whenever I see a mobile station it says something like NUL GPS or something strange in the course/speed field of APRS.... Maybe someone could tell me what commands to enter in the TNC so when I plug the rs232 off the Magellen it should work.
Ron

457. GPS registration

From: RonN9QGS@aol.com

If they're using TTL levels, why not build up a small interface circuit with a Max232C or a Max233C from Maxim semiconductors? 232 requires 5 caps and a 5 volt regulator while the 233 requires only stable 5 vDC power, all the "glue" is on the chip.

Ron,
Get the v6.0 ROM for your KPC-3 and it will be easy. The new ROM has a bunch of new commands and modifies some others. I use my Garmin75 or my Motorola Oncore.

The new commands are GPSHEAD which selects the headers of the messages to look for. Then there is LTRACK and BLT which control the beacons. You will setup your UNPROTO path to something like WIDE,WIDE (Local convention??) I have my system sending out every 2 minutes. The Garmin and the Motorola update the KPC-3 every two seconds so the data is fresh. I use the RMC message or the GLL, and VTG messages.

The biggest problem is the cables all over the car and the extra antennas.

Message-ID: <950524124611_10884708@aol.com>
Rendered body type: text/plain

Does the HSP cable described in the IBM docs work with a Mac? Obviously I would need to change the DB-9 in the second half of the description to a Din-8.

Are the slashes from the emitter of the second transistor supposed to represent ground? If this is so, why didn't you just draw a line from there to the ground line running from TNC to computer? The drawing is just a little confusing ... I am also used to seeing the transistors with the arrows, a little hard to do in a text drawing (hi), and it has been so long I can't even recall whether the arrow is the emitter or the collector, but I think it's supposed to be the emitter ... (don't laugh at this ex-electrician and future EE <grin>, it has just been too long since I fiddled with this stuff hands on).

And oh yeah, if I understand this correctly, this will not cause any loss of information since the change in DTR causes the TNC to hold the data until the DTR goes back high again. Yes, no, or maybe?

FYI..

Press Release: June 1,
1995

1995 ARRL Digital Communication Conference
Sep 8-10, 1995
Arlington, Texas (minutes from DFW airport)

Permission is granted to reprint any or all parts of this press release.

Full text is available on the Internet:
FTP: ftp.tapr.org WWW: http://www.tapr.org/tapr E-Mail: tapr@tapr.org

It's time to make your travel plans and put the finishing touches on your work for the upcoming 14th Annual ARRL Digital Communication Conference.

The ARRL Digital Communication Conference is an international forum for radio amateurs in digital communication, networking and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communication Conference is not just for the digital elite, but for digitally-orientated amateurs of all levels of experience.

The 1995 Digital Communication Conference will be held on Sep 8-10, 1995, in Arlington, Texas; minutes from Dallas/Ft Worth International Airport, in the middle of the country, and airfares have never been cheaper for this conveniently located conference.

Not only is the Digital Communication Conference technically stimulating, it's a weekend of fun for all who have more than a casual interest in any of the ham digital communication modes. This includes PBBS operators, networkers, DX PacketCluster SysOps, software writers, modem designers and digital satellite communication enthusiasts. The Digital Communication Conference is for all levels of digital operators--a "must" conference to attend to get active on a national level. Now more than ever, Amateur Radio needs this great meeting of the minds because it's important that we demonstrate a continued need for the rich frequency allocations we now have by pushing forward and documenting our achievements. The ARRL Digital Communication Conference is one of the ways to record our accomplishments and challenge each other to do more.

What can you expect during the 14th annual Digital Communication Conference?

- * A full day of papers and breakouts on Saturday for the beginner to the advanced amateur digital enthusiast.
- * Two workshops, one on APRS on Friday and one on making use of the new PCS (Personal Communication Service) technology on Sunday.
- * A Texas-sized banquet with a special guest speaker.
- * Special Interest Groups (SIGs) on Saturday following the banquet.
- * Informal get-togethers throughout the weekend.
- * A facility perfect for this type of meeting.
- * Vendor area and informal engineering discussions.
- * Scores of nearby restaurants and entertainment (Six Flags Over Texas, The Ballpark at Arlington, Wet 'n Wild, golf).
- * An event at which the most important new developments in amateur digital communication are announced.
- * Digital "movers and shakers" from all over the world in attendance.
- * Plenty of Texas hospitality!

In addition to the presentation of papers on Saturday, two workshops will be held during the conference. On Friday, Keith Sproul, WU2Z, will hold a workshop on APRS packet-location software. Keith is chair of the TAPR APRS Special Interest Group, developer of the Macintosh version of APRS, and a leader in the area of APRS technology. This is a unique opportunity to gain insight into this fast-growing new digital aspect of amateur operations that combines computers, packet radio and Global Positioning Satellites (GPS). On Sunday, Dewayne Hendricks, WD8DZP, will conduct a workshop focusing on a survey of Personal Communication Systems and their applications and use in the Amateur Radio service. Dewayne is an expert in the area of commercial wireless systems; his company WarpSpeed Imagineering, focuses on wireless Internet. This workshop presents an opportunity to learn how Personal Communication Technology (handheld and small business wireless systems) can be used in the amateur service.

The 1995 Digital Communication Conference is cohosted by Tucson Amateur Packet Radio (TAPR) and the Texas Packet Radio Society (TPRS). TAPR has been active as an international amateur research and development organization since 1981 and was responsible for development of the TNC-2 and other amateur kits and publications. TAPR has more than 2500 members worldwide. TAPR continues to provide leadership in digital amateur radio activities by supporting Special Interest Groups, conferences/meetings, publications, and research and development projects. TPRS has been active as an organization since 1984 and has been responsible for the development of the TexNet network in Texas, Oklahoma, Arkansas and Missouri. TPRS

membership now tops 500 members.

Anyone interested in digital communication is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. If you know of someone who is doing great things with digital communication, tell them about this! Papers are due by July 21, 1995, and should be submitted to Maty Weinberg, ARRL HQ, 225 Main St, Newington, CT 06111, or via the Internet to mweinberg@arrl.org. Please contact Maty for detailed format requirements.

If you've attended a Digital Communication Conference in the past, remember how much fun it was discussing the latest developments into the wee hours! If you've never been, make plans now to attend and find out how much fun the Digital Communication Conference can be.

There are few activities where the importance of your participation can be so much fun and important! What a great way to share and renew your enthusiasm for digital Amateur Radio! Getting together with colleagues from all over the world and bringing each other up to date on your latest work. All this and more, for an unforgettable weekend of ham radio and digital communication. Make your travel and lodging arrangements now. We hope to see you at the ARRL Digital Communication Conference on Sep 8-10!

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E Tanque Verde Rd, Tucson, AZ 85749-9399; 817-383-0000, fax 817-566-2544; Internet: TAPR@TAPR.ORG

Sincerely,

Greg Jones, WD5IVD, President, Tucson Amateur Packet Radio
Dave Wolf, W05H, President, Texas Packet Radio Society

If you need handouts or flyers for meetings, contact TAPR about getting what you need!

Hotel Information

Conference presentations, meetings and workshops will be held at the La Quinta Inn and Conference Center, 825 N Watson Rd, Arlington, TX; 800-531-5900, 817-640-4142, fax 817-649-7864, intersection of I-30 and TX 360. Rooms rates are \$53/single, \$58/double, \$63/triple and \$85+ for suites. When making reservations with the hotel, indicate that you're attending the conference. Six Flags (larger than Disneyland), the Texas Rangers and other attractions are within a few miles of the hotel. If you plan to stay at the hotel, it's highly recommended that you book your room prior to August 25, 1995--a block of 100 rooms is reserved for Friday and Saturday. The hotel provides transportation to and from D/FW International Airport. Contact the hotel to arrange airport transportation.

Registration

Contact the TAPR office by Phone, Fax, or e-mail (Internet: tapr@tapr.org) to preregister or for additional meeting information. MasterCard and VISA accepted.

Digital Communications Conference

=====

- Preregistration (before August 21) \$30 *
- Late Registration or at door \$35 *
- * - Conference Registration includes:
Conference Proceedings, Sessions, Meetings, and Lunch.
- Saturday Evening Dinner \$17 **
- ** - Dinner, Speaker, Prize Drawing (Limited Space)

Workshops

=====

APRS Workshop, Friday, 4-7 PM, conducted by Keith Sproul, WU2Z

- Preregistration (before August 21) \$10
- Late Registration or at door \$15

PCS Workshop, Sunday, 9 AM-1 PM, Dewayne Hendricks, WA8DZP
Survey of Personal Communication Systems (PCS) Technologies and their application and use in the Amateur Radio service

- Preregistration (before August 21) \$10
- Late Registration or at door \$15

Contact TAPR to register for the DCC.
Tucson Amateur Packet Radio, 8987-309 E Tanque Verde Rd, Tucson, AZ

466. GPS set-up

From: "John W. (Bill) Hays, W00MV" <billh@netins.net>
Date: Wed, 24 May 1995 12:16:22 CST
To: aprssig@tapr.org
Message-ID: <00990D58.A56BBD55.63@netins.net>
Rendered body type: text/plain

I have a friend who has a Motorola XT Oncore Model PVT602N323.
The format it is doing now is RMC. He would like to add GGA.

He has tried, using a dumb terminal program, to change the type to GGA
by typing the string that starts with 0\$0 I think it was 0\$GP GGA,<CR><LF>0

At any rate he was following the example in the manual he rcvd with the
unit. It had no effect and the unit continued with the original 0RMCD
output.

Any ideas?
73 Bill W00MV

Here is something that might be of interest that came to me this morning.
Marvin - WB6PKK

Subject: GPS & PDF Maps

OTC 22-May-95 08:51 Trimble and Adobe Align to Reach Next Generation
...

MOUNTAIN VIEW, CALIF. (May 22) BUSINESS WIRE -May 22, 1995--Trimble
(Nasdaq:TRMB) and Adobe Systems Incorporated (Nasdaq:ADBE) announced
today that they have signed a marketing and technology agreement
signaling their intention to integrate technologies. The agreement
will offer the possibility of a new generation of navigational device
which would display high quality maps linked to a variety of other
information containing rich text and graphics. These devices would
take advantage of Acrobat Player technology, an embedded version of
Adobe Acrobat software, and

Trimble's GPS satellite-based navigation, positioning and
communication data products. Acrobat Player technology supports the
basic functionality of Acrobat software in a highly portable and
independent implementation for computer-based appliances, such as
navigation systems. Like Acrobat software, Acrobat Player supports
Adobe's Portable Document Format (PDF), a universal file format that
preserves the fidelity of graphically rich information across computer
platforms.

Navigation systems using Acrobat Player will be able to display
high quality maps in a compact format that can be easily linked to
related information such as hotel and restaurant guides, service
station listings and airport directories.

"Acrobat Player redefines how consumers can use navigation systems,
allowing these devices to provide access to a broader range of
information in a very easy to use fashion," said Dave Vaughn,
Trimble's Executive Vice President of Tracking and Communication
Products. "The navigation systems market is rapidly expanding into
consumer areas such as automobiles. By developing leading edge
products and forming strategic relationships with companies like
Adobe, Trimble can better meet the demands of these new market
opportunities and set new standards for the industry as a whole."

PDF files are substantially smaller than many other image file

formats, including the bitmap and short vector formats typically used in navigation systems. As a result, navigation systems based on Acrobat Player technology will be able to provide greater amounts of information in a single system. Because Acrobat software supports information created by virtually any authoring tool, OEMs building navigation systems based on Acrobat Player will be able to integrate a variety of content in a single environment, including existing maps and any other relevant graphic or textual data. This content can also be used on desktop systems since files in Adobe's PDF format can be used by anyone with Acrobat software.

"This is an exciting relationship because it combines Trimble's leadership in global positioning solutions for air, land and sea applications with Adobe's complete tool set for creating and delivering rich digital information," said Deborah Triant, Vice President, Marketing, Adobe Systems. "Together, the two companies can enable new products that will provide real benefits to consumer, government and commercial markets."

Trimble is a world leader in the emerging commercial markets for GPS satellite-based navigation, positioning and communication data products. These products are sold worldwide for diverse applications including land and hydrographic survey; GIS data acquisition; military; general, corporate and commercial aviation; marine navigation; vehicle tracking and communications; and mobile GPS. The company also manufactures and sells GPS engines for the OEM market. Founded in 1978 and located in Sunnyvale, Calif., Trimble has been a leader in providing GPS solutions since 1984.

Adobe Systems Incorporated, founded in 1982, is headquartered in Mountain View, California. Adobe develops, markets and supports computer software products and technologies that enable users to create, display, print and communicate electronic documents. The company licenses its technology to major computer, printing and publishing suppliers, and markets a line of applications software and type products for authoring visually rich documents. Additionally, the company markets a line of powerful, but easy to use, products for home and small business users. Adobe has subsidiaries in Europe and the Pacific Rim serving a worldwide network of dealers and distributors. Adobe's 1994 revenue was approximately \$598 million. -0- Note to Editors: Adobe, Acrobat and Acrobat Player are trademarks of Adobe Systems Incorporated or its subsidiaries, which may be registered in certain jurisdictions. All other brand and product names are trademarks or registered trademarks of their respective holders.

4800,n,8,1

The command is

\$PMOTG,GGA,n,^M^J

where n is the desired frequency of repetition in seconds and the control-M and control-J are absolutely required. A dumb terminal will do this... Oh, yes: The caps are required. It's not tolerant of upper/lower case switching.

Keith, a suggestion that I put on my registration that I mailed to Bob:

Allow one call sign to *ack* any messages sent to ANY of the SSIDs of that call sign. Example: KA9VNV could be set to *ack* any messages sent to KA9VNV-3, or KA9VNV-?? if there were more than one remote station.

This comes up because I've had three different people send traffic to my automated weather station, KA9VNV-3, which does not run any APRS software. It simply reads the weather station at the county courthouse, and reports what it finds. No human present, and I haven't made the scripts fancy enough to send *ack*s out. If my base could *ack* them, they wouldn't spend the next few days bouncing around the net, as they're periodically resent.

In a way, it's strange - I don't see people sending messages to other automated weather stations in the area, just mine... which isn't set up to deal with them. I got one last night from somebody who wants my weather station to phone him up at work... about an hour after I posted a beacon saying -3 can't reply...~

Use the Motorola.Bas program provided with APRS. It runs under QBASIC and
works just fine. Make sure the cable is built properly from the GPS to the TNC.

Dave

Maybe I am missing something, but does your friend have a PC compatible
computer connected up (or can he connect one)? If so, I take the easy way
out and use the QBASIC written Motorola.bas program that came with APRS.
It lets you set up the sentences and the rate. Don't be surprised if you
get an error when you try to use his VIEW command. Half the time it doesn't
work!

I too have a Web site for APRS info, mine is still under construction, so I had not announced it yet, but since someone else has, I will too..

Obviously, mine is going to be more aimed at MacAPRS, but it will have lots of stuff about both versions.
Anyone that has connected to my PERSONAL home page would have seen a pointer to it already, since it has been there for a couple months now.

>>I have used my Meridian for about 4 months now with great success.
>> I finally did give up and buy the factory cable
>>I bought the accessory KIT.

I have a Magellan too but the more I hear about the Garmins the more I'm convinced that the Magellans are overpriced and much less flexible than the Meridians, XL's and Trailblazers. I'm in Tampa on business for a couple of days and happened to notice an E&B Discount Marine next to the Courtyard I was staying at...I had the opportunity to check out several different units. The Garmin 40 and 45's are much smaller than the Magellan units, accessories are much less expensive and versatile. (The DC power and NMEA cable is only \$27 over-the-counter). One thing I have always complained about the Magellans is acquisition time...my Trailblazer sometimes takes 2-5 minutes to acquire...even in open sky. The clerk was very nice and let me do some side-by-side testing in the parking lot. The Garmins in all cases acquired in less than 10 seconds as compared to the 30-90 second acquisition on the Magellans. In a cold start, initialized situation the Garmin only took 3 minutes to the Magellans 8 minutes.

Based on this little shopping excursion my Magellan is going up for sale

when I get back to Massachusetts Thursday....I think Garmin is the better choice. Here's what I found in general:

Garmin:

GPS40 \$249 (Internal antenna only)
GPS45 \$299 (Detachable antenna, external connection, 10 hour batt. life), 250 waypoint
GPS75 \$499 A cadillac
Floating storage case \$17
GA-28 Remote antenna \$150
Fixed mount bracket \$30
Power/Data Cable \$28

Magellan:

Meridian \$299 Detachable antenna, (5 hour batt life), 100 waypoint
Meridian XL \$349 (same as above but with course plot)
Nav5000DLX \$699 (new for 1995)
Bracket/cable combo \$80
data/power cable alone \$47
external antenna \$180

Apelco:

GPS15 \$599 Only tracks 5 birds, E&B dude called it junk (same for the Hummingbirds)

The guys at E&B here in Tampa say they sell the Garmins over all the others combined by 10 to 1. The differential receivers that work with the Garmins, Magellans, Eagles, and Apelcos sell for only \$489 and will remove the SA offset all together. The guys at E&B was really helpful...he said you can also expect to see prices drop 20-25% at most boat shows...there you can really pick up deals on closeouts or just plain good deals in general. E&B also sells instructions tapes for each brand of GPS. They also sell a neat little universal mounting bracket with suction cups for sticking it to the windshield, or a tilt back for desktop or dashtop mounting and a lip for hanging it over a small edge (like a cup holder)...this nifty little thing sells for only \$15. (Looks like a good mounting solution for HT's too!)

Am I missing something with the Garmins? Anybody want to buy a brand new trailblazer with nmea/power cable?

73,

Tim N1BTQ

Thanks for the help to "new user" on setting up the unproto path for a duel port KAM. I sent off the query during a very frustrating 3:00am session after not being able to set my HF path for gate, wide without changing my VHF path to the same, which resulted in a warning about linking from VHF to HF even when I was only transmitting on HF. On the fifth re-reading of the aprs documentation, I discovered very clear instructions in the HF.txt. Thanks again and sorry for the QRM. Steve AC6DR

1995 ARRL Digital Communications Conference
September 8-10th, 1995
Arlington, Texas (minutes from DFW airport)

On Friday Sept 8 , Keith Sproul, WU2Z, will hold a workshop on APRS packet-location software. Keith is the Chair of the TAPR APRS Special Interest Group, developer of the Macintosh version of APRS, and a leader in the area of APRS technology. This is a unique opportunity to gain insight into this fast growing new digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning Satellites).

I will be looking forward to this conference.

I hope we can find a time and place to hold a birds of a feather meeting. I will be happy to compile a list of the APRSSIG members attending the conference. E-Mail (kc5ejk@onramp.net)

I was wondering after I get my Mobile set up how do I need to go about creating roads by just driving them, I heard it was very simple, but have no clue what is involved, do you need it hooked to a TNC or can I do it over the air to another station and log the data that way (even if I use simplex) so I can send updates very often...)?

486. Magellan Meridian pinouts

From: Dick Mead <mead@skat.usc.edu>
Date: Thu, 25 May 95 9:49:21 PDT
To: aprssig@tapr.org
Message-ID: <CMM.0.90.2.801420561.mead@hamal.usc.edu>
Rendered body type: text/plain

These are the pin assignments for my Meridian. I consider the top pin, when looking at the back, with the unit rightside-up, to be pin 1. The connector on mine is a vertical slot with 6 pins at the lower left edge on the back. Mine is circa 1993, yours may differ.

Pin 1 == +6.0 VDC
2 == N/C
3 == TX Data + (I use the DCE mode, so this goes to RS-232 pin 3)
4 == N/C
5 == TX Data - (goes to RS-232 pin 7)

6 == DC ground

I used IC socket pins with small shrink-wrap when I made my cable. I only used the data pins then, however. I have since gotten the commercial cable.

On all the PC's I tried, the data flowed fine. On some Macs, a bias resistor was required between pins 2 and 3 (referring to a 25-pin RS-232) so the data lead could swing negative enough for the Mac to see data.

Dick WB6NGC

Thanks very much, Dick. I will put this info to work this weekend, as my trailblazer arrived yesterday (perfect timing!). I was a bit surprised at how long the trailblazer takes to acquire the satellites, and how easily it loses their signals. I may take a look at the Garmin line before my ability to return the trailblazer expires... I have heard that the Garmin 45 is more sensitive.

73 and thanks

Hello Sam

I saw your post about APRS. I'm about to get started in APRS here, maybe we can keep in touch. My first try will be MacAPRS on my Mac.

I'm involved in Jefferson County ARES/RACES and Search and Rescue.

I recently attended a class in Port Angeles presented by two Pierce County fellows on urban rescue. Very interesting and informative. If there is ever an earthquake in Port Townsend, we are going to need it.

I also did something similar. I used socket pins from a db connector, put shrink tube on the pins and placed them in I believe a molex plastic housing and carefully potted it with epoxy and shaped it to fit the GPS. I also found that the regulated voltage in adjusts the contrast so if you use a 5V 3 terminal reg you will have to bias it about 5.75 if my memory serves me correctly. I finally returned the meridian for a NAV 1200 which better suits my marine requirements.

I need help,, I was running aprs68a on a 486/66.
Now running the same rev or 69 , I get the following problem.

APRS will not int the TNC. In fact it will not talk to it??? (intermiten)

I must re-boot. (the system locks when leaving APRS) @ SAVING BACKUP.BK.

Switching to windows AEA PK program all is OK? When I try to restart APRS it hanges again.

Using procomm I can talk to the TNC ... but again when aprs is started the tnc hangs.

I left the TNC connect for 12 hours in the windows mode and copied all traffic on the aprs freq.

I have also tried an other TNC PK232 MBX.
??
MY Break Out Box shows no control line problems.

Hi, i need some help. I just received my USGS 1:100,000 CD and extracted the files i was after. Then following the documentation by Ken Swaggart W7KKE i used CONV100.BAS. All that went well. Then i went to the MAPFIX.BAS program to attempt to import the files. Well first question is how can i import these files without first having a map to import them into. Second question when doing the ALT-U it asked me to enter the following ENTER PATH AND S?? TO USGS FILE. Well i don't know what the S?? stands for, in my case the path is D:\MAPS this is the directory i have everything in including the extracted CD files. Could it be that the S?? means scale i don't really know right now. I have tryid several ways but MAPFIX just sits there not doing anything. Sure would like to start making some maps Hi.

Make sure PK-900/PK-232 is in COMMAND mode not HOST mode when you exit Pakratt. There is an option called "Host mode on exit" This should be turned off.

496. Re: [APRSSIG:1364] MFJ crystals

From: "Roderick, Ren" <rroderick@intp.intp.com>
Date: Thu, 25 May 95 18:33:22
To: aprssig@tapr.org
Message-ID: <9504258014.AA801452002@intp.intp.com>
Rendered body type: text/plain

OK. I bought one at Dayton, only paid \$95 for it on Sunday.

Here is the Crystal data from page 7 of version 1A of the manual:

-----Start of page 7-----

ORDERING CRYSTALS:

You may order crystals for other channels factory-direct. Crystal

specifications are:

Receiver Crystal:

Operating Freq - 10.7 MHz	
XTAL Freq. = -----	
3	My calculator says that is
	45.0300 MHz for 145.79
TYPE 3rd Overtone (44-MHz range)	Looks about right
TOLERANCE 0.003% Commercial Standard	=====
TEMPERATURE 26-Degree C (room temperature)	
LOAD Series	
CASE HC-25U or FM-2	

Transmitter Crystal:

Operating Freq.	
XTAL Freq. = -----	
8	My calculator says
	18.22375 MHz for 145.79
TYPE: Fundamental Mode (18-MHz range)	OK
TOLERANCE: 0.003% Commercial Standard	=====
TEMPERATURE: 26-Degree C (room temperature)	
LOAD: 32 pF, Parallel	
CASE: HC-25U or FM-2	

Crystals for the MFJ-8621 may be ordered directly from:

JAN Crystals
PO Box 06017, 2341 Crystal Drive
Fort Myers, FL. 33906-6017
Telephone (800) 526-9825, FAX (813) 936-3750

When ordering from JAN, simply tell the sales person that you wish to order a pair of crystals for the MFJ-8621 Data Radio and give the *operating frequency* in MHZ. JAN has complete MFJ-8621 crystal specification on file in their ordering system and no additional information is required. Alternatively, you may purchase crystals from:

International Crystal Manufacturing Co., Inc. (ICM)
PO Box 26330, 701 W. Sheridan
Oklahoma City, OK 73123-0330
Telephone: (405) 236-3741, FAX (405) 235-1904

For receiver crystals, order 471270-CRYSTAL FREQ (not the operating freq.)
For transmitter crystals, order 434275-CRYSTAL FREQ (not the operating freq.)
JAN and ICM both welcome telephone orders and accept MasterCard or VISA.

-----End of page 7-----

PLEASE calculate your own crystal frequencies. I just used the Calculator in WINDOWS to do this (complete with all of its inaccuracies!).

I haven't yet ordered crystals, so I can't personally vouch for the accuracy of the information printed in the MFJ manual.

Good Luck!

As we've all been discussing the MFJ and its crystals, howabout the first person who gets one putting the specs for ordering crystals here on the mail list? That way, we can go about the business of ordering the crystals at the same time we order the "wrong" units! [grin]

Hello Jeff & Thanks for the Message.

Yes, I would very much like to keep in touch. I think all of Western Washington should have a better way of working together between the different counties. Like you say, during a real disaster we will have to and we should be practicing that now.

Anyway, we plan on putting APRS on at least one repeater site. (APRS Frequency not know yet, may have to coordinate with WWARA) and would like to put up an ATV repeater also. Hopefully we can outfit the ESAR kids and 4 X 4's with all of this stuff. We already have about 25 Garmin GPS. Some are Garmin 75's and some are Garmin 45's.

If you can hit it I am usually on 145.370 (PL 136.5) as this is our primary emergency repeater. You might also catch me on 146.640 (PL 103.5). If you can't hit either of these let me know some you can reach and I will give them a try. I live on the South Hill of Puyallup and have pretty good coverage from here.

Here are a few other ways to contact me if you would like:

Enter it into a new (and therefore blank) map. Use the NORTHWEST control point in the first part of the 100k USGS file (it's in the header within the first 20 lines) to determine the mapfix point-of-origin. Then do an ALT-G, and after it's entered a layer, save it to a file. Then, do it again, and save it to ANOTHER file. etc.

> not doing anything. Sure would like to start making some maps Hi.

You'd have made your life a lot easier extracting the 100k files to another directory. Makes it easier to keep track of. Since I've had to blow away all my CD files (and don't feel like going up to the library to check more out, aren't the filenames referenced to something S-ish somewhere in the file name? It's looking for a pointer, and builds a name from the info you give it.

You also want to go grab conv100c and mapfix68. They work much better than the others...

73, gerry

500. APRS Registration

The first thing to check is the INIT file in the \SYSTEM directory.
Version 69 has a new INIT file. If you made any changes to this file
when you originally installed APRS, you must make these changes again.

Good Luck.

Message-ID: <950526072914_13174981@aol.com>
Rendered body type: text/plain

I was told this disk is available for just over \$32? There are 2 versions, which version would I want for APRS applications, Is this disk good for Mac also, cause I may be playing with a Mac in the future and don't want to buy 2 disks. Can you view the data off the disk with their viewer? I am assuming this is a media type topographic map (quad) for the whole United states or maybe half of the united states, correct? Who do I write to and what is shipping?

503. Meridian Pin out

From: RonN9QGS@aol.com

Date: Fri, 26 May 1995 07:40:04 -0400
To: APRSSIG@tapr.org
Message-ID: <950526073916_13176929@aol.com>
Rendered body type: text/plain

I was wondering, I don't know if I am the only one experiencing this problem, but I just edited a whole area of Chicago, and the maps lines in Red (Major Roads) is very dim if they run N and S, and the rest of them running East and West are nice and noticable, I find that the gray also is very different then the E and West. What can correct this so the North South roads show just as well?

509. APRS for Skywarn,Races,Ares

From: wnolle@fly.HiWAAY.net
Date: Fri, 26 May 95 08:30:26 CDT
To: aprssig@tapr.org
Message-ID: <Chameleon.950526083957.wnolle@wnolle.HiWAAY.net>
Rendered body type: text/plain

Our plans have been to mainly use APRS for heavy weather in conjunction with the local Red Cross and the ham community. Well after nearly two years we have finally got the system in motion and several weather stations have been placed. We finally installed a Digi on top of one of the local mountains and figured we would be in great shape for the next severe weather condition. Well folks guess again. After we installed the digi and started seeing other digi's we also started seeing a lot of HF stations from all over the country and Canada!. At any given time i had 4 screens full (47 stations showing)on my map. After several days of this i decided to do some testing if this would hamper the idea of using APRS for this type of function. I started sending messages at different times with or without the HF traffic present!. I can tell you right now forget using APRS for Skywarn,Races or Ares unless you have a dedicated frequency just for an operation like that. We have 145.790 as the coordinated frequency in this area, but looking at this right now i would say this frequency will never fly for this purpose. I asked several HF APRS users if VHF users can also beacon to HF, Well the answer i got rather made me want to turn off my computer,TNC and radio and forget the whole thing. One person told me that at Bob's request not to beacon VHF station onto HF because it would clutter up the HF map to much. Well friends that's what is happening on VHF. I don't understand this anyway. Why would an HF station beacon onto VHF anyway when they can communicate much better just on the HF band?. I am not trying to knock APRS or Bob or any of it's users, i have been using APRS from it's inception but as things are don't waste your or the other peoples money attempting to use APRS for community service on 145.790Mhz. We had a demo at the Birmingham hamfest and there where several poeple there from the NWS and they sounded very optomistic about a community using a system like APRS. Well this was during a time of day when no HF stations were present. We again had planned to have a BIG demo at the local Huntsville,AL hamfest in August, well as it stands right now i would totally disagree with attempting such a demo for it would be a flop if there was a band condition allowing HF station to show on the VHF frequency. We have regular meetings once a month and our first topic of course will be this question (Should we abandone this idea).

APR REPLY: Many TNC's are having problems with the command PAR 0 which I put in the InitTAPR.TNC file. This was needed to set up the MFJ TNC's to the right parity. Now it seems that the KAM does not like PAR 0 but prefers PAR 4. Maybe your TNC does not like PAR 0 either? Use a text editor to change the file in APRS\SYSTEM\InitTAPR.TNC.

Bill,

Maybe a request to Bob to provide an HF filter that would ignore the GATED packets would be a practical approach.

APR REPLY: PA0RYS in Uitgeest Netherlands just sent me a paper Map of
Europe and the Netherlands in detail. But the N map has no LAT/LONG
references, and I hesatate to begin the European map because it is not a
mercator projection. If you guys in Europe have made some maps already,
then I need them so that I can complement your efforts and not waste time
duplicating them.

I notice that most european maps (2 that I have seen) do NOT use the color GREEN for the fastest autobasins? But our INTERSTATES are coded GREEN in APRS. If I continue to make the fastest roads green will that confuse europeans?

Oh, contact PA0RYS in the Netherlands via his friend:
smink.t@applelink.apple.com. I am not sure of the decimal in the address, that was sent to me in all uppercase in a typewritten letter by PA0RYS who may not have the address letter-perfect.?

> I agree, but suspect MFJ would only lower the price about \$10 if they
> didn't include crystals... Partly because they STILL have to put
> crystals in it sometime to test it, so it would cost them to take them

APR REPLY: Write or call MFJ. I encouraged them to start stocking 145.79 and they (the boss) agreed that they would, if the demand was high enough. SO THEY WILL DO IT IF ENOUGH OF US ASK THEM TO! I assume that once they get the production bugs out of the radio, they will settle down and figure out that APRS trackers may be 50% of their sells of these radios??? So BUY your 145.79 XTAL from them so that they SEE THE DEMAND... OR SEND THEM A LETTER.
p.s You could try to sell your 145.01 xtals in San Francisco area (APRS FREQ there) but since they all come with .01, nobody needs them there! hi hi

> a statement that it would clutter up the HF map too much....

APR REPLY: Its NOT the map clutter that is the concern, ITS THE CHANNEL CAPACITY. Mathematically you will soon see that routinely GATEing VHF users to HF will kill the APRS HF network. I see about 40 users on HF. That keeps the 300 baud HF channel pretty busy...

Now if you add to that, 50 users in Wash-Balto, 80 in Calif, 40 in AZ, 50 in Florida, 50 in Ohio, etc, etc, all beaconing 1200 baud via their VHF gateways onto the 300 baud HF channel, nothing would get through AT ALL. Also with all of these potential VHF-to-HF gateways all over the place, there is NO WAY TO CONTROL it or "turn the function OFF" in case of emergency traffic or other special needs.

The reverse, gating HF into VHF nets is NOT much of a problem, however. The most you will see is the additional 40 HF users added to your existing VHF net. If you dont want to clutter your local map, simply ask the local HF gateway to turn OFF or put his call in your BUD list (OFF). The important point is that you OR your local net DOES have control over this added load.

NEW IDEA! I do agree that sometimes one does NOT personally want to clutter his own map with GATEwayed HF stuff. I will add a feature in 6.9+++ whatever, that will allow a user to IGNORE incoming HF gateway stuff. Thanks for the feedback... I believe the MAC already has this.

More on the PK-12:

Using BBSMSGs will sort of solve the problems, but ONLY if you then modify INITTAPR.TNC to look like INITAEA.TNC. And then also tell APRS that you DO NOT use an AEA. The problem is that BBSMSGs ON makes the stuff coming out of the PK-12 to look like a standard TNC, but it still needs to see the unique AEA commands coming IN during initialization.

Please pull some more hair out, and try to find a way to make the PK-12 work with BBSMSGs OFF. Trying to tell people to turn BBSMSGs ON and then to tell APRS that it is NOT an AEA but then putting all the AEA commands into the file named InitTAPR.TNC will just totally confuse everyone, hi hi..

Thanks...

Bill Nolle

If what you are being told about APRS wants to make you turn off your radio, WHY DON'T YOU. I, for one, am tiring of hearing your unfounded and ungracious complaints.

1. Either you are being fed incorrect information or you are misinterpreting what you are being fed.
2. I suspect you are not as familiar with the program as you think you are.
3. Gateway'ing has nothing to do with map/object density.
4. Read the docs and then ASK about your perceived problems instead of complaining about what usually turns out to be non-problems.

I'm having fun with this and I wish you wouldn't come across with such rudeness. 73 de Boyd AR

Hi Bob.

My name is Aitor Arrieta (XE1YAW) and i live in Mexico City. Past Tuesday i send to you the registration form and the money for the APRS Shareware (\$24.00 dls) and the GPS registration (\$9). The total was \$33.00. I already have the software version 6.8B. XE1KK buy one to you at Dayton Hamvention and give me a copy. So the only thing that i need know are the two registration numbers. I really appreciatte i you can send me these two numbers by this way.

Also i have a question to you. Yesterday i try to make one test with the software. The configuration is a 486dx2 66mhz, and a dsp2232 from aea, with a FT736r radio. This is my satellite rig. I put another tnc (a little kantronics) with a walkie talkie and a terminal. I program the beacon of the kan tnc with the following message !1968.00N/09933.00y HOLA XE1YAW.

In the line 25 of the APRS screen i recieve No>p1 XE1YAW*>BEACON:....
I read in your manual that No> means that the software don't find the >to field. But i don't know why. Then i send with the aprs a POSIT packet i recieve in the Kantronics TNC, the i just change the Latitud and longitude fields and send back to the aprs software in unproto converse mode with the APRS destination address with the same result. I know that i am doing something wrong but i don't know what. Could you help me please.
Thank You in Advance
Best Regards
Aitor

> import these files without first having a map to import them into.

APR REPLY: I always use somwthing like USA.map or something else closer to my area. Once you do the alt-U, the map you initally have on the screen just to get your bearings, is ignored.

> Second question when doing the ALT-U it asked me to enter the following

> ENTER PATH AND S?? TO USGS FILE.
> Well i don't know what the S?? stands for, in my case the path is
> D:\MAPS this is the directory i have everything in ...

APR REPLY: The S?? prompt is reminding you to include all of the filename including the PATH up to the last two characters in the filename. For example for a file named ABCxyzRD.GRF you would respond to the prompt with D:\MAPS\ABCxyz and then MAPFIX would add the RD.GRF on the end. The reason for the S?? is because the original 2,000,000 XTRACT program ALWAYS named files in a format Sxx_RD.GRF. I was just making it less to type. Now I suppose it is time to change that prompt to ask you to enter the complete file name since with CONV100 it can be anything...

Thanks for the reminder to change that...

I was going back thru my mail and found your message, I don't know if I responded or not, so I am going to 'again',

Yes, I have written code for the Rockwell GPS, it is not straight forward, but it is not to difficult either, espically if you know 'C', there are 'C' libraries available for it.. I wrote the Mac library, and I also have the PC library..

These libraries are available, and I could give them to you, but Bob is not going to implement it into his code. If you were into doing something like the 'BASIC STAMP' computer, you could easily write code to take Rockwell in and output NMEA.. I have already done this within MacAPRS..

If you have any other questions, just ask..

HF stations don't beacon on to VHF, and there are no band conditions that allow HF to show on VHF frequencies. The only way HF shows up on VHF is thru a GATE station. One who has both HF and VHF and RE-TRANSMITS the HF beacons onto VHF.

Maybe you should talk to the local GATE stations in your area.

Whoa, Bill, slow down.....take a deep breath, here are a couple of facts
which should help....

#1. HF stations can only appear on VHF station maps if there is a KAM
GATEway operating within VHF range....in an actual emergency, ask the
control operator to discontinue HF relays during the emergency period.

#2. The HF to VHF relay system exists primarily to allow mobiles to use
VHF transmissions to be relayed throughout the HF nationwide system.
You, however, have an amateur radio license... if you are General Class
or above, you have the privledge granted to you to set up your own HF
station, no one can tell you that you can't.

#3. But, yes, the control operator of the HF Gate can tell you not to
digi through him, (and he can prevent it with the BudList if he wants
to), but nothing in the system prevents you from temporarily using the HF
Gate to communicate.

#4. In an actual emergency, the HF GATEway provides an alternate method
to pass traffic out of the local area, and, in fact, enhances communications.

#5. You can also prevent the reception of HF to VHF beacons by changing
the name of your wide area digi from the GENERIC WIDE to some other
term. Typical HF Beacons are sent GATE,WIDE or GATE,WIDE,WIDE...they
will only digi through the generic ALIAS....

Just a few suggestions....many of us are very successfully using APRS for
Skywarn and ARES applications.....I myself run the GATE here and RACES
owns the WIDE.....

Good Luck, if you need any more suggestions...let me know

To: APRS Sig <aprssig@tapr.org>

Message-ID: <2FC6C361@ipnovell.fibusa.com>
Rendered body type: text/plain

Hi all:

I picked this up from sci.geo.satellite-nav:

try this: Turn you GPS off, hold the <ENTER> button while you turn on the GPS again. I'll then get a window of moving rectangles. Press <ENTER> again and you'll find something interesting. The displayed screen show the keys which will be marked if you press it, but it also show:

SIGNAL	2387
DRIFT	-21.462
FREQ	16368351
TEMP	21
BATTERY	506
TIME	23:33:57

Yes, you GPS really seems to be able to messure the temperature. I put my receiver outside and it show 12 after 15 minutes. In the room it shows around 22. Seems to be all in Celsius.

Anybody know how to get the temperature without entering the test-mode? Any chance to get it via the Garmin protocoll?

You could turn off the GPS which seems to be the only way to exit the test-mode.

Another funny feature: Switch to the map screen and turn off the GPS. If you release the button before it counts to zero the GPS won't shutdown, but the world still turnes on the screen as long as you don't use <PAGE> or <QUIT> to change the screen.

The Motorola documentation specifically says (and so does the NMEA documentation!) that the checksum is OPTIONAL. So, it doesn't need to be there. It is provided for data integrity.

- > You, however, have an amateur radio license... if you are General Class
- > or above, you have the privledge granted to you to set up your own HF
- > station, no one can tell you that you can't.

If the local area cannot cooperate on activities, the system will falter.

- > #3. But, yes, the control operator of the HF Gate can tell you not to
- > digi through him, (and he can prevent it with the BudList if he wants
- > to), but nothing in the system prevents you from temporarily using the HF
- > Gate to communicate.

Except that the HF nets, at least in my area, are smooth gonna miss the areas of the state I'm interested in. Not digi'ing through the GATE is probably good. You're not interested in getting Skywarn info out to the world, but informing your local net.

- > #4. In an actual emergency, the HF GATEway provides an alternate method
- > to pass traffic out of the local area, and, in fact, enhances communications.

Great theory. Bad practice. Period. You're entitled to your opinion, but the confusion on HF, especially without a coordinated effort "elsewhere" means you're giving the world the Skywarn info, which may be interesting, but is not doing you much good.

- > #5. You can also prevent the reception of HF to VHF beacons by changing
- > the name of your wide area digi from the GENERIC WIDE to some other
- > term. Typical HF Beacons are sent GATE,WIDE or GATE,WIDE,WIDE...they
- > will only digi through the generic ALIAS....

Again, the bandwidth is the issue. The more junk digi'ing through the area, the less bandwidth available for the Skywarn net.

- > Just a few suggestions....many of us are very successfully using APRS for
- > Skywarn and ARES applications.....I myself run the GATE here and RACES
- > owns the WIDE.....

Great. As the unofficial pessimist for this group, with a few years of nets and emergency activities behind me, I look skeptically at "great, new" ideas. My personal recommendations include a separate frequency for APRS activities, isolated to the local area and sending, especially, the locations of the spotters. I operate under the concept that the spotters are to be busy spotting and should not need to report their movements when it can be done automatically. Further, the spotters shouldn't have to pound the keyboard (standalone trackers instead) since they should be spotting, lest the funnel descend upon them while they're trying to relocate the cloud on the net. And FURTHER, I think the digital net should be separate from the voice net. Say, on UHF and not widely published. It, like the standard RACES operations, should be operated as a directed net without a lot of extraneous stations intervening.

I'm sorry, but Bill raised valid points and most of this group spent their time attacking his style.

Gerry

546. '95 DCC Proceedings Deadline

1995 ARRL Digital Communications Conference
Proceedings Deadline Information

Anyone interested in digital communications is invited to submit a paper for publication in the 1995 Conference Proceedings. Presentation at the Conference is not required for publication. If you know of someone who is

doing great things with digital communications, be sure to personally tell them about this! Papers are due by July 21, 1995, and should be submitted to Maty Weinberg, ARRL, 225 Main Street, Newington, CT 06111 or via the Internet to mweinberg@arrl.org. Please contact Maty for detailed format requirements.

Deadline: July 21, 1995 (Friday)

Start writing those papers now!

This is your opportunity to let others know what you have been doing.

547. Re: [APRSSIG:1498] cool gps stuff

In looking to get ideas for "Cows In Space" antennas I got a couple of antenna xrays on the Garmin GPS55 AVD antenna. It's a quadrifilar helix with a matching array at the base. After looking at it for a while, I contacted M/A Com and got info on their passive (the VP OnCore I'm using has an LNA preamp onboard and uses a passive) and active lines. For \$36 (passive, small quantity) and \$52 (active) it was hard to justify the effort of building and tuning something up.

548. MFJ DATA RADIO

From: jeff.brenton@espi.com
Date: Sat, 27 May 95 00:40:14 -0500
To: aprssig@tapr.org
Message-ID: <9505270040.00XXD00@espi.com>
Rendered body type: text/plain

Bob "I'm so sunburned" Bruninga commented on my comments about MFJ stocking 145.79 crystals... They do, and will ship right away, but they don't (it seems) plan to ship radios with them installed, except for custom orders. I've put in an order for 2 so far, to be shipped with .79 installed; how soon I get them is the question!

Maybe the BBSMSGs on command is what is making my TNC reset every once in awhile. Ken from AEA is sending me a new ROM chip for the PK-12 that he thought would fix the problem but I just we will still have to go back to the drawing board.

Thanks for the info...

I thought his complaint was the map was too crowded. I deleted the

original message so I can't check. If the problem is a crowded frequency then eliminating the gateway is about the only solution. My mixup I guess.

Re: Bill's first message and Gerald's reply....see I don't always repeat the thread....

Gerald, you do make a good point I missed about selecting your own frequency for special events/emergency events....If APRS is so popular or so cluttered in your area on the "standard" frequencies that it is unusable for an emergency event....preselect another unused packet or experimental simplex frequency from the band plan and use it.

Here in the Tampa Bay area, prior to APRS, all emergency packet activity was on the primary BBS channel in Tampa....That was a mess but was necessary because the permanent digipeaters were already in place...

When APRS came along, the permanent digis were moved to 5.79....but perhaps we are fortunate, the vast majority of APRS users here are ARES/RACES affiliated...those that aren't support our use of the system during weather events and appreciate the ability to monitor the activity....

PS: APRS is used as a visual reference/backup for Skywarn here...it is not the primary frequency....Primary traffic is handled in the typical directed voice net fashion with the support of the local hams and repeater associations....

So the question still remains- is the radio 25.00 or so MORE with the "useful 145.79" (to some) xtals then, or do they let us have a credit for the "useless 145.01" (to many folks) .

I think they should substitute the xtals gratis. The radio will probably not need serious tuning to move from .01 to .79 .

I see the real utility in letting the remote/mobile spotters SPOT, and not
have to figure out a range and bearing or grid square to tell NCS. NCS or an
assistant can add storm symbols for those guys based on the voice reports.
I'm concerned that there's going to be an influx of APRS-Skywarn applications
where we send folks out to the boondocks and tell 'em to make the DF entries,
send reports digitally, etc. I consider that less than optimal. I'm glad I
was wrong here.

I wanted to set the record straight, first of all i want to thank those that send me messages to help to solve the problem. Then of course i received several messages from users that did not read the whole message. In fact some of those messages were just nasty. Those people did not read my message. I have no problem with the HF users showing on our VHF maps, but rather all the TRAFFIC THAT COMES WITH IT.

Then there were those telling me to move to another frequency, well friends i have worked hard and have taken much time to coordinate 145.790 in this area. In fact i have the only coordinated digi in this area (Others are saying the heck with coordinating an APRS digi). So friends why should i move??.

And yes we do have regular APRS meetings once a month, but of course not everyone can attend these for the simple reason of distance. But i am starting to write an APRS Newsletter with the hope that we can work together in that form. I am retired and dedicate a lot of time to making APRS work in this area to let it all go to waste due to one person GATEing all that HF traffic to VHF.

Then there were those that told me i must not know how to run APRS. Well i have never been too much interested in seeing HF users on the map, therefore i have never been interested in how gates or crossband digipeating works.

In any case i again want to thank those that are actually helping to solve this problem for us.

P.S: It may very well have already been solved. the user creating all this must be reading the APRSSIG also because i have not seen all the HF traffic in the last couple of days Hi.

FORWARDED MESSAGE

From: DKAPLAN@netins.net (David Kaplan)

Bob, I deleted the messages I sent to you but the Internet Address is:
<http://sun1.cr.usgs.gov/>
They have all the 1:2,000,000 and 1:100,000 maps of state boundaries, transportation, hydro features etc...FREE for the downloading in both the STD and Option format. I don't know enough about the map making process but from what I have read in the documentation---THIS IS WHAT PEOPLE ARE BUYING FROM THE USGS AND IT THERE FOR FREE!

APR COMMENT: For mapmakers, remember to get the GRAPHIC format if you are getting 1:2,000,000 data and to get OPTIONAL format if you are going to attempt to use 1:100,000 data.. Also, be sure it is delimited.

WOULD SOMEONE WHO WORKS WITH MAPFIX and CONV100 routinely using maps downloaded off the internet, Please consider writing a INETmaps.txt file and send it to me. We need a standard gouge sheet to tell folks how to do it.

559. Garmin 45, Great Buy

From: RonN9QGS@aol.com
Date: Mon, 29 May 1995 22:51:31 -0400
To: APRSSIG@tapr.org

Message-ID: <950529225129_16782661@aol.com>
Rendered body type: text/plain

Hi Everyone!

I am sending back my meridian, and today picked up a Garmin 45, Talk about nice, I love the Garmin, for many reason! Gives your positions down to tenth of seconds, (Meridian doesn't), The speed over ground is quicker update then the Meridian, More information on the screen, easier to see what direction your going with the moving compass reading, versus the Meridian half compass, more waypoints, more everything, tells your battery power. Satellite information, signal strength and where there located relative to where you are. Just so much, I think the only disadvantages the Meridian may have is Altitude data and SOG over 90 kts. I found the Garmin, easy to wire up vs the Meridian for some reason, less involved. BUT THIS DOES BRING ME TO MY NEXT QUESTION>

What are the NMEA sentences about, I know I can decode these:

GPGLL
GPRMB
GPRMC
GPRTE
GPWPL
GPBWC
GPXTE
GPRSV
GRGSV

I was wondering what some if these have (information wise?)

I know GLL is just latitude and longitude
anf VTG gives Heading in Madnetic and True, and Speed Nauticle and Kts. (I WISH Statuate)

I was wondering which of the above does APRS recongnize? Help eliminating some of the choices, I believe one does both Lat/Logit, Heading, and Speed?

I think that is best suited... DOES APRS show Speed and course in the Position screen? If so what is it, MPH, Kts, Kph?

Ron

Just need another TNC so I can see me on the APRS screen.
Coming in about a week!

Rendered body type: text/plain

Hello All:

I've asked Bob to consider adding weather symbols that are used by the National Weather Service. My list of symbols includes one for:

- hurricanes
- thunderstorms
- severe thunderstorms
- funnels or tornadoes
- rain
- snow
- drizzle
- rain shower (there is a distinction between rain and a rain shower)
- snow shower (ditto)
- ice pellets (sleet)
- fog

lightning visible (thunder not heard)
haze
smoke
Sand or dust raised by wind
blowing snow
freezing rain

Obviously we wouldn't ask Bob to include all 100 of the standard synoptic symbols so some of the above are generalizations. If I've left any important ones off or you can improve the list feel free to add your comments or suggestions.
Thanks,

Jeff, N4TRY

Rendered body type: text/plain

I used the Max-232 to make the Garmin output RS-232 and used a direct feed of the computers RS-232 into the Garmin for use with MacGPS and other programs that load data into the tables in the GPS.

A Mac233 or DS233 design will need less parts as charging pump in in the chip.

Data sheets available via Internet from Dallas Semiconductor.

(Note the MAX232 / MAX233 is inverting so run the signal through twice, thanks to Chad R. Larson for telling me that.)

I hope this can help someone.

I have exchanging E-mail with Lorne Dudley about Garmin Computer interfaces and he posted this message in sci.geo.satellite-nav.
This is what he did.

I hope this can help someone.

BOB KC5EJK Dallas kc5ejk@onramp.net

----- Lorne Dudley posting -----

From: <DUDLEY2@QUCDN.QueensU.CA>
Newsgroups: sci.geo.satellite-nav
Subject: Garmin GPS50 / computer interface circuit
Date: Fri, 26 May 1995 09:05:21 EDT
Organization: Queen's University at Kingston
Message-ID: <95146.090521DUDLEY2@QUCDN.QueensU.CA>

Since asking for assistance a couple of weeks ago, I received many notes giving hints and suggestions. Among those providing assistance and support were Rane Curl, Reg Neale, Peter Bennett, Phil Sohn, Larry James, Bob Winingham, Tom Dawes-Gamble, Mike Walters, Randy Bowman.

I borrowed an oscilloscope and other electronic gadgetry and with the help of local computer techs set down to explore the problem.

The summary is that the GPS50 provides NMEA output, not RS232 or RS422. It's a current loop output device, and depends on a resistive load to provide RS232 and RS422 voltage swings. According to the computer techs here, there is wide variety in the design of COM ports and the impedance presented to current loop devices.

In a following post, I am publishing a computer interface which

Parts List

Qty

- 1 quad op amplifier, LM324N, Radio Shack 276-1711, \$2.99 CDN.
- 2 diode, 1N4007, or equivalent (not critical)
- 1 zener diode, 5.1v, 1N4733, Radio Shack 276-565, \$1.69 CDN.
- 5 resistor, 8.2K, 1/4 watt
- 3 resistor, 8.2K, 1/4 watt

End

 To: aprssig@tapr.org
 Message-ID: <9505280030.00PUS03@espi.com>
 Rendered body type: text/plain

Ralph Fowler asked if MFJ was still charging \$25 extra for the 145.79 crystals, even when they weren't shipping the never-to-be used 145.01 crystals; the answer, apparently, is yes, according to R&L Electronics. The only advantage to special ordering the units pre-crystalled is that MFJ will install them at no *additional* charge *for labor*.

So, the radios will be \$107.95 + \$24.95 = \$132.90.

Hi Bob.

My name is Aitor Arrieta (XE1YAW) and i live in Mexico City. Past Tuesday i send to you the registration form and the money for the APRS Shareware (\$24.00 dils) and the GPS registration (\$9). The total was \$33.00. I already have the software version 6.8B. XE1KK buy one to you at Dayton Hamvention and give me a copy. So the only thing that i need know are the two registration numbers. I really appreciatte i you can send me these two numbers by this way.

Also i have a question to you. Yesterday i try to make one test with the software. The configuration is a 486dx2 66mhz, and a dsp2232 from aea, with a FT736r radio. This is my satellite rig. I put another tnc (a little kantronics) with a walkie talkie and a terminal. I program the beacon of the kan tnc with the following message !1968.00N/09933.00y HOLA XE1YAW.

In the line 25 of the APRS screen i recieve No>p1 XE1YAW*>BEACON:....

I read in your manual that No> means that the software don't find the >to field. But i don't know why. Then i send with the aprs a POSIT packet i recieve in the Kantronics TNC, the i just change the Latitud and longitude fields and send back to the aprs software in unproto converse mode with the APRS destination address with the same result. I know that i am doing something wrong but i don't know what. Could you help me please.

Thank You in Advance

Best Regards

Aitor

Just wondering if anyone else run accross this problem.

When i use the X-M and you enter it to close together of course you get the message XMT ABORTED (Wait 8 secs). Well last night that message was permanent untill i restarted APRS.

I anyone making maps on/for the Mac?

What application are you using and what are you using for data source?
Is anyone using the USGS map data available via ftp? How are you using which variety of dataset?

I just "discovered" the Garmin GPS-45, MacAPRS, and the USGS ftp site... are there any "old hands" out there who can provide some advice for a beginner?

I have had some of the same problems with several Windows programs. It seems to vary and if I try several on the same port I can get them to fail in many rather unpredictable orders. The same trouble does not happen running DOS. It seems to be the Windows port driver. That would explain why you can cure it by shutting down Windows. The problem is that the exit of one program does not properly exit the port driver or the driver software does not clear the port hardware, which is itself a controller chip. I "solved it" by finding a communications program that included, and loaded, one.

Over the weekend I made a new set of HIWAIII maps, a second 32 mile map of the Puget Sound area, and a new map of ATLANTA. These are in the file called NEWMAPS.zip on the ARN BBS. Again, these maps are almost turn-key to make using the MAKEMAP.bas program BUT also remember that they are from the 2,000,000 CD ROM, so they look like and have accuracy comparable to a state-highway map under a magnifying glass.

Hi Larry,

We've essentially been doing this already. Our ultimate goal is to set up APRS stations in the NWS offices and would like to keep things as consistent with what they're used to as possible. Also, the larger symbols tend to clutter up the maps a bit, and we're hoping the additional symbol set will help clear things up. I understand from Bob that all the symbols currently in use will remain and these will just be extras. Thanks for the suggestions.

Rendered body type: text/plain

The concept of band planning for differing packet uses has worked well here in northern california for several years. Our digital coordinators recognized the need to allocate specific frequencies for each type of digital activity. With usage allocation all your fears of folks putting their bbs systems on 79 are lessened.

Our bbs forwarding sysops will not forward traffic to a new bbs unless that bbs is on a bbs frequency and has a proper forwarding frequency.

NOW is the time to work with your digital coordinators to establish a nation-wide UHF frequency. The suggested 445.925 frequency is not suitable in most of the west. This is a repeater or link frequency in the expanded 440-450 repeater band. In our area this frequency is an input to three voice repeaters and is used as an auxiliary link frequency to four other repeaters. I suspect that other areas of the nation, especially the major metro areas will report similar coordinated voice activities on this frequency. The days of coordinating a nation-wide packet frequency from a barn in Newington are over. We must work with the regional band planners if we truly want to reach our goal.

I am willing to start the ball rolling by suggesting we look at 431 MHz. All the cheapie radios will work at 431 MHz. I beleive it is possible to establish a nation-wide APRS usage frequency in this band if we all are willing to participate in upcoming repeater and digital band planning meetings. This may take a year or two for all the groups to agree. Other special interest digital applications are on the horizon, we must all work together to facilitate this emerging technology. I find the discussion on whether to sell cheap 79 crystals totaly out of order.

Good regional band planning and reasonable coordination of wide digipeaters should be the real discussion on this list.

Fellows in the South East may want to participate in the band planning sessions mentioned in the following post to rec.radio.amateur.digital.misc

DIGITAL OPERATORS TO BE INVITED TO

SERA SUMMER BOARD MEETING

5/28/95

This message is about packet/digital communication, band-planning, frequency coordination, and the SouthEastern Repeater Association.

Representatives from the digital community in the 8 SERA states* will be invited to the SERA board meeting in Knoxville this July to discuss how SERA and the digital groups can better communicate and cooperate. This message is being sent from the North Carolina digital groups, Packet>East and CDCC (Carolina Digital Coordinating Council). Now some details:

As you may know, SERA revised its UHF band plan last year. The band plan covers the entire band, 420 - 450 MHz, and affects all modes using the band. There were significant changes made for digital operation. Channels have been set aside for both narrowband and wideband digital, some with 5 MHz offsets that can be used as repeaters or duplex link channels. This band plan offers digital operators a lot more than we've had under the old ARRL plan, and it offers structure and order for future growth, rather than the uncoordinated hodge-podge of frequency utilization we have now.

While this looks good, it didn't sit well with many of the node and BBS sysops here in North Carolina. We didn't like being handed a band plan we didn't help write, and we resented it being administered by "someone else" -- SERA. We did recognize that the plan had a lot to offer, and was something we needed. We also recognize that the band plan is just a start, and further coordination is needed to help systems work together under the plan.

I wrote to SERA on behalf of Packet>East, and was invited to attend the January '95 board meeting. There I learned that SERA does NOT want to administer a digital band plan, at least not beyond being the coordinating body for digital repeaters. And it does NOT want to take over the jobs of the existing digital groups.

But SERA does want to find a way to bring representation from digital operators onto the SERA board, and make its resources available to the digital community.

As a guest at the January meeting, I proposed this idea for the summer meeting: The SERA board meets Saturday afternoon and Sunday morning. I proposed that digital groups meet separately on Saturday, to discuss what the problems and needs are in the RF area of digital, how SERA can help solve those problems, and how we think we could be a part of SERA. On Sunday, we would meet with the SERA board to present our conclusions. (SERA will provide a meeting room for us on Saturday at no cost.)

The options for participation are pretty wide open. Again, SERA does NOT want to absorb or take over any existing digital groups. But one idea floated is to add to the board an assistant Director for digital in each SERA state. This would be a voting position to represent digital interests in spectrum management, and that person may handle digital frequency coordination. This is just a starting point, and questions like "who would elect this person" are undecided.

The next step is to invite participants to the meeting, to be held in July in Knoxville (the exact date isn't available yet). If you are interested, I would like to hear from you, ASAP. SERA President Dave Shiplett, AC4MU, and I will be sending invitations soon. I'd like to know a little about your involvement in packet/digital, and what groups exist in your state, but I think anyone with a serious interest in planning and coordinating the RF end of amateur VHF/UHF digital should be there.

You can reach me at these addresses:

585. The GPS Computer Interface

From: kc5ejk@onramp.net (Robert Winingham)
Date: Tue, 30 May 1995 21:04:54 -0500
To: aprssig@tapr.org
Message-ID: <v01510102abf17b79cf55@[199.1.11.180]>
Rendered body type: text/plain

Lorne Dudley <DUDLEY2@QUCDN.QueensU.CA> built the OP amp circuit
with the Radio shack parts. I built the RS-232 line driver and MAX232
layout. The line drivers needs +- 12 volts so i don't think they are
as useful as the MAX232 design which only needs 5 Volts.

I just have all the circuit all over my desk not on a board or in a
cable hood. Putting a MAC233 in a RS-232 data hood might be a popular
project for GPS users.

I cheated on the device I do use with my Garmin-45

..

I have an ICOM CT-17 communication interface (CI-V) Level Converter
that allows a computer RS-232 to control a ICOM rig. The unit uses
a MAC232 Chip. I just used the two extra set of pin not being used
on the MAC232 to change the Garmin output to normal +- level RS-232
for the computer. I did need to run loop through two of the buffers
as they invert the signal.

I placed a 1/4 amp fuse in side the unit and steal power for the GPS
from the CT-17 unit. I also added a power plug to go to the KPC-3
so all devices get power from one source.

The output Signal from the computer to the GPS was just a direct connection
and has worked fine. I did not need any buffer or level conversion.

I added 2 cables with different RS-232 female connectors from the
CT-17 . One for computer connection so that I have a GPS input for MacAPRS
and the other is for the KPC-3 TNC/GPS for stand alone remote use.

RS-232 pins 2 and 3 are swapped in one of the connectors. The RS-232
cables are for use one at a time not both together. This is NOT a HST
setup.

Always watch out for RS-232 pin 2 and 3. The pin with the negative 4
to negative 12 volts is usually the Transmit pin and 7 is always ground.

Bob KC5EJK Dallas -- kc5ejk@onramp.net --

> to Chad R. Larson for telling me that.)

Cute, but not consistent with my results. Still, I'll look at this and confirm it. Even if you had to "run it thru twice" it still beats the socks off the 1488/1489 combo.

587. Re: The GPS Computer Interface

From: rwf@mindspring.com (Ralph Fowler, N4NEQ)
Date: Wed, 31 May 1995 00:18:28 -0500

Message-ID: <199505310412.AAA03706@dylan.mindspring.com>
Rendered body type: text/plain

I was originally going to send this as Email to Lorne Dudley and Bob, KC5EJK, but after reading it I decided it was probably informative enough to place on the SIG. It details some lessons I learned in GPS interfacing.

Lorne and Bob-

I use IBM PC Clones of many varieties. When I first got a Garmin 45, I was told by Garmin that the levels were "not standard RS232", that "the official Garmin cable had a circuit in it to convert levels" and that I "should make a level converter". So last year, I did what you are suggesting.

After going to the trouble to make the MAX232 device (yes, it worked) I re-read Bobs docs about using the pullup resistor to accomplish a "level shift". So I tried that as a way to lower the parts count. In a later conversation with Garmin, the Tech there admitted this time that their \$150.00 PC cable was straight through and that the original data cable would work fine if connected straight to the computer. The little data/power cable now sold for \$28.00 was included with my 45. (Great deal, huh- I paid 469.00 bucks for it in September <g>)

I threw out all my circuits, tried the suggestion, and had no problems. As a matter of fact- I have had no problems with ANY computer and have even used the HSP adapter sold by PacCom. After reworking one small problem, even it worked. There have been NO level problems using the Garmin 45 and any of the PCs I've tried PC directly.

So my question is this: Is it that the MAC is not as "compatible" with the various voltage levels flavors of RS232 that are out there, and this circuit is really required, or are you doing as I did- going by what someone told you? I was really frustrated to see that I had wasted the time and energy cobbling up those circuits when it was not really needed.

588. HSP Adapter, GPS, and Laptop interfacing

From: rwf@mindspring.com (Ralph Fowler, N4NEQ)
Date: Wed, 31 May 1995 00:42:01 -0500
To: aprssig@tapr.org
Message-ID: <199505310436.AAA06869@dylan.mindspring.com>
Rendered body type: text/plain

I hope others on the SIG can benefit from this experience:

For the first 6 months after purchasing my GPS, I used it with APRS in the car, driving around in "James Bond Mode" plotting my tracks on APRS maps. I even plotted an entire 2.5 week trip to Florida and around the entire state! I had only one serial port on my laptop computer, so I kept procrastinating about connecting the TNC into the system. Just never got around to building the Hardware Serial Port Adapter.

Ran into Gwyn Reedy from PacComm at "Ham Radio 95" in Atlanta this year and decided to spring for the assembled HSP adapter that his Company manufactures. It didn't work with my Compaq 386-25 LTE laptop. Messed around with it for quite awhile before realizing the problem. The circuit as provided by PacCom relies on there being power available on pin 6 of the computer's 9 pin connector. It "borrows" this power to operate its switching transistors. Bob B. and I originally thought that it was too much voltage drop through a couple of diodes- but the problem was just : No Power.

I was using a DRSI TNC at the time, a DPK 1200 I think, and found that I just needed to reroute the power wire to pin 6 of the TNC instead of the laptop. After the change, the thing worked great!

At Dayton I picked up a KPC3 TNC. New problem. 25 pin connector wouldn't mate with 9 pin cable on PacComm HSP adapter. Changed plug to 25 pin. No workie!
Found that this TNC had no power on pin 6. Ended up adding a jumper in the TNC that allows you to feed 12 V into the TNC through the 25 pin connector. Just used this pin to "borrow" power from the TNC instead. It now works like a charm!

Lessons learned:

1. It would be nice if PacComm had an extra conductor going to the TNC in case power has to be obtained there. I had to tie wrap an extra conductor to the jacket of the TNC cable.
2. Not all TNC serial connectors (or PCs) can be relied upon to have anything standard other than transmit data, receive data, and ground.
3. Be prepared to change the plug on the HSP adapter cable unless you use a TNC with a 9 pin connector. (Why *does* Kantronics use that big 25 pin plug anyway? Takes up half the rear panel!)

> DIGITAL OPERATORS TO BE INVITED TO
>
> SERA SUMMER BOARD MEETING
>
>
>
>5/28/95
>
>This message is about packet/digital communication, band-planning,
>frequency coordination, and the SouthEastern Repeater Association.
>
>Representatives from the digital community in the 8 SERA states* will be
>invited to the SERA board meeting in Knoxville this July to discuss how
>SERA and the digital groups can better communicate and cooperate. This
>message is being sent from the North Carolina digital groups, Packet>East
>and CDCC (Carolina Digital Coordinating Council). Now some details:
>
>As you may know, SERA revised its UHF band plan last year. The band plan
>covers the entire band, 420 - 450 MHz, and affects all modes using the
>band. There were significant changes made for digital operation.
>Channels have been set aside for both narrowband and wideband digital,
>some with 5 MHz offsets that can be used as repeaters or duplex link
>channels. This band plan offers digital operators a lot more than we've
>had under the old ARRL plan, and it offers structure and order for future
>growth, rather than the uncoordinated hodge-podge of frequency
>utilization we have now.
>
>While this looks good, it didn't sit well with many of the node and BBS
>sysops here in North Carolina. We didn't like being handed a band plan
>we didn't help write, and we resented it being administered by "someone
>else" -- SERA. We did recognize that the plan had a lot to offer, and
>was something we needed. We also recognize that the band plan is just a
>start, and further coordination is needed to help systems work together
>under the plan.
>
>I wrote to SERA on behalf of Packet>East, and was invited to attend the
>January '95 board meeting. There I learned that SERA does NOT want to
>administer a digital band plan, at least not beyond being the
>coordinating body for digital repeaters. And it does NOT want to take
>over the jobs of the existing digital groups.
>
>But SERA does want to find a way to bring representation from digital
>operators onto the SERA board, and make its resources available to the
>digital community.
>
>As a guest at the January meeting, I proposed this idea for the summer
>meeting: The SERA board meets Saturday afternoon and Sunday morning. I
>proposed that digital groups meet separately on Saturday, to discuss what
>the problems and needs are in the RF area of digital, how SERA can help

Ron N9QGS typed about his recent purchase of a Garmin 45, and wanted to know if it could be set to statute miles. If the 45 is anything like the 55, one of the menu options is "UNITS", which will allow changing from Nautical/Knots/Feet to Statute/MPH/Feet to Kilometers/KPH/Meters.

N> Thanks Barry
N> n9vjq
N> n9vjq@aol.com

I had a similar problem with my U-II equipped 386-25. APRS would run for a few hours, or a day or so before crashing. A reboot was necessary to bring the machine out of its coma.

The fix: replaced 16450 UART equipped serial board with one that uses 16550 UARTS. APRS has not crashed since the upgrade.

My hunch is that the 16450 UARTS (with no FIFO) were unable to properly buffer data from the TNC or U-II while the PC was off doing other things, like writing the HST file to disk, etc. The 16550 UARTS have a small FIFO buffer that allows them to better handle the buffering demands of multitasking and other processing that occurs while the COM ports are active.

re: Ralph Fowler -> APRS port switch didn't work - no power from PC pin 6.

A running production change in late April now has the PacComm APRS port switch powered from the TNC's DSR line in addition to the computer pin 6. We figured out the problem about the same time as Ralph did.

I'm looking to purchase one of the new (in the UK) Garmin PK90 handhelds, for use both with APRS and without. I'm told by the dealer that the manufacturers power/data lead can be used for either data transfer OR external power, but not both at the same time. Can anyone confirm this, and whether postings on APRSSIG in the past about the Garmin 45 cable will also apply to the '90?

Anyone got any general observations about any features or aspects of the GPS90?

There are two cables for the Garmin-45

One: Comes with the Software and has a 9 pin (F) PC plug on the end
for data only - power leads not in PC plug

Two: A power/data cable with a fuse, that can do both at once.
The Garmin end is 4 pins the other end is just bare wires
1. Xmit
2. Rec
3. Ground -- common to data and power
4. + power (5 to 20 Volts for Garmin-45)

Interesting, Bob. There must be 3 cables. When I bought my 45 in September, 1994- (for 469.00) It came "free" with the mobile bracket and the data cable. Garmin plug on one end and bare leads on the other. No Fuse. Glad they got smart and added a fuse so folks wouldn't burn something out! :)

Also I found with the Garmin, along with getting the Earth spinning in the Map display, use the arrows and you can speed it up and slow it down, change the direction. Fun!

I found two show stopperd in the version of USGS2MAPS on ARN BBS. There is a corrupt line in the instruction print area with reference to menus. Just delete that line completely.

Also the program expects the merged .gra file to be in c:\aprs\makemaps. If not there you must create dir and put it there or change ine in program . To change line search for word c:\aprs\ and change to location of your files.

I put USGSMA.zip on ARN for those who can't ftp from this board. It is merged file for mid atlantic states and worked great for me.
Good luck.

My Vote.... keep the sig open to all subjects that interface with APRS....

My current equipment

Home:
GPS - none
TNC - AEA original PK232
Radio - ICOM IC271H
Antenna - Diamond 500 base at 75' agl
Computer - either Pentium 60/win95 or 486sx33/wfwg3.11

Shop:
GPS - none
TNC - MFJ 1270C or whatever is on demo at time
Radio - ICOM 2AT
Antenna - Hustler G6 at 35' agl
Computer - whatever is on Demo

Mobile:
GPS - Garman 45 (just got it last week and fell in love with it)
TNC - KPC3 ver 6.0 eeprom (perfect tnc for mobile) had a tiny-2 originally here
Radio - ICOM IC28H
Antenna - Valor dual band thru the window mount
Computer - Samsung 286 laptop mono screen

cable system - GPS mode for capture use output from GPS to both tnc and laptop in parallel. Use Telix on computer to capture output from GPS for making detailed maps later at home.
APRS mode run GPS to TNC input output of tnc to Laptop. Can view all activity on freq. but no TX as I have not registered GPS part yet.

National CANADIAN and Western New York APRS Frequency is 144.390
WIDE area digi's locally are VE3YAP Georgetown, VE3YYZ Toronto,
W2ICZ-2 Buffalo NY, KE2VW-2 Colden NY

The HP 100LX and 200LX are palmtop DOS machines with a serial port, PCMCIA (type II) slot, and Infra Red port. They come in two models: 1MB ram and 2MB ram. The 200 (which I have) comes with the following apps which operate in a graphic environment much like Windows: appt scheduler, phone book, word processor, Quicken, Lotus 123, an HP calculator program (many neat functions), cc: Mail, data comm program, LapLink, a file manager-like program, a couple games, and a few other pgms. The 200 1MB costs about \$460 on sale at Service Merchandise...but if you want good current info check out comp.sys.palmtops newsgroup. You'll find most of the postings geared toward the HP models. Also, rumor has it there's another HP model coming out soon...check out the newsgroup for the FAQ and other gouge.

Why would you want one? Let me tell you what we do with them:

- Great portable packet PC's! They run on two AA batts. Combined with a HT and KPC-3, they make a nice tiny packet setup using the built in comm program. We run APRS on them as well.

- The fact that they are DOS machines makes them handy. If it works on a PC it will likely work on the HP. As an example, we have a homebrew program we use to make maps for public service events that was compiled from QBasic. Connect the HP to a GPS and we record the data in a .RAW and .HST format. Great for making maps! Someone recently EMAILED me and mentioned running a SAT Tracking pgm on one...nice when watching for visual passes.

- The use of the built in apps is obvious. I have a nice 14.4 pocket modem which allows me to check on my mail on the road...

I'm not here to sell you one...but I can only say that it's a nice tool that I use for hobby and work.

Hi Bob and All On The SIG,

Just wanted to add my vote to those wishing the PS/2 Mouse Port was supported, and while I'm at it wishing for appropriate video modes for Windows operation (in a Window). But I can't say enough good about the dedication and effort Bob and many others put in keeping a great program always evolving. And I understand that because time is limited improvements have to wait their turn. So, my vote is in...

A word about local operations in San Angelo, Texas: We have four or five local stations monitoring or at least beaconing positions. The sparse population allows us to operate on 145.01 without complaints, and some stations digi through Midland (110 mi WNW) and even Lubbock (170 mi NNW).

One station is usually set up as an HF Gate, and another is running his Ultimeter II on AUTOWX. We have two ops that sometimes appear as APRS mobile, using Garmin 45 and Motorola GPSSs. 73s, Dan

I'd refer the interested to the following reference:

<http://www.navcen.uscg.mil>

You'll find a whole world of info there about the LF beacons and the DGPS plan. And, Al, they're coming soon to a harbor near you!

> BTW, I'd be real interested in seeing a data engine, DSP sound card,
> or other DSP implementation to demod the USCG (or other common
> standard) DGPS beacon..... anyone hear of such?

An interesting thought. And probably do-able, but I don't even have the time now to look into it. Any takers?

> Also... I'd be curious about the improved accuracy that I might get

> sends individual corrections for each satellite.... not this method...

Wander by the local University library and grab the Spring, 1986 Journal of Navigation (the US one; there is a British journal with a similar name). Look for the report by Special Committee 104 on DGPS recommendations. That'd give you definitive answers.

9. APRS WX/U-II Help

From: N9VJQ@aol.com
Date: Sun, 2 Jul 1995 11:12:56 -0400
To: aprssig@tapr.org
Message-ID: <950702111255_106552001@aol.com>
Rendered body type: text/plain

I need some assistance with my setup. I thot I read everything in the docs and this list about it but I can't seem to solve my problem. Here it is:

I have a GRIDPAD Model 1910 (8088) w/ 1 serial port
KPC-3 w/ Ver. 6.0 Firmware
AZDEN PCS-6000
U-II w/ Raingauge
Paccomm HSP switch

My intention was to make a mobile WX APRS/U-II reporting station using the Gridpad, KPC-3, U-II, etc.

When the U-II is plugged into COM 1 and the TNC is to COM 2 of my 386, everything works fine. The TNC puts out WX info supplied by the U-II. I just can't use my mouse. Oh, well!

But when I plug in the HSP switch to the GRIDPAD, and try to hook the U-II to it, here's what happens:

1. If I try to tell the program at startup that I have the TNC and WX on the same port, it tells me I've got a COM port conflict, and ignores me.

2. If I go thru the startup as TNC only and then try to go to activate the HSP option at the Alt-S-Gps-Hsp command, it seems to dump me into GSP, ask for my GPS validation #, then gives me a HSP Timeout prompt in the upper rt corner. And N-command gives me N9VJQ New:er MPH ____.

I was under the assumption that the HSP switch allowed use of two devices on 1 COM port.

It also works the same on the 386.

What am I doing wrong?

Thanx
N9VJQ Barry Leonard

APR REPLY: All APRS ranges are from the center of the screen in Nautical miles (comes from my NAVY RADAR background). This makes a "32" mile map be about 64 miles tall by maybe 85 or so miles wide. Notice that the MAPS-PLOTS-RANGE command draws a range circle in STATUTE miles and in very recent version, you can change the display to read in KILOMETERS. Also in this recent improvement, the MAPS-PLOTS-RANGE command now shows the range and bearing to the cursor in GREAT-CIRCLE coordinates.

> it with QBasic.

Remove a few of the unneeded PRINT statements (such as those for Digitizer) in Mapfix12 and the program should run fine. I had the same trouble. 73 Dan

This did the trick. The program runs fine now. Thanks to all for their help.

APR COMMENT: I guess the thing is just too big. I have been disturbing the EXE version in the upgrade files (not enough room in the distro copy). So look for compiled copies of both MAPFIX12.EXE and MAKEMAP1.exe. I assume that the EXE versions do not cause people the memory problem??? Use the F2 convert command with caution, however, until version MAPFIX13 comes out. If you must use it, do the conversion, immediately save the new map (under a new name) then reload it, and if all looks well, proceed.

APR REPLY: If anyone knows the inside track and can figure out how to get APRS accepted as a legal format permitted on the new channel 70 marine band digital channel, it would sure open up a lot of possibilities for SAR in the boating world. I think strong demos like

the above to the right CG personnel might make the trick. The CG can just say "OK" if they wanted too, (i think).

APR REPLY: For the last several versions, and for the foreseeable future, I am trying to eliminate most 64 mile and smaller maps from the standard APRSxx.zip DISTRO. The removed maps are being moved to the REGIONAL MAP files such as E, SE, C, and Wmapsxx.zip. This process will make the DISTRO file smaller, and the regional map files larger.

Each time that I remove a 64 mile map from the USA distro, I bring in its interstates and its major RED roads into the next higher 256 mile map. You will notice that the ARLAMSAL.map is now VERY full of roads. I have also done this to OH-MI-WV.map and am now doing IAILINMO.map.

FOR THIS REASON, make sure EVERYONE that is new to APRS understands that they MUST also get their REGIONAL or LOCAL map distributions, or they are missing all their local maps.

> But when I plug in the HSP switch to the GRIDPAD, and try to hook the U-II to
> it, here's what happens:

APR: It aint gonna work. The HSP only works cuz teh software is looking for both TNC and GPS data on the same port. The U-II data is just asccii characters, and it is not easy to tell which is domming from which. So, for now HSP is only for GPS unit sharing...

15. Mapfix

Rendered body type: text/plain

Hi'ya All!

I finally picked up 7b yesterday but when I went to use Mapfix12 it crashed before it even got started! After seeing the first screen which shows the changes each upgrade, it crashes back to QBasic with an "Out of Memory" error and lands the cursor on the last DIM statement. Now, I did save the previous messages on deleting PRINT statements, but that has not helped. I have been using Mapfix68e with no problems (other than running out of memory if I load a map with lots of points). I am running a 386 with 2M of RAM.

If someone has a cure, great. Otherwise, I'll just go back to 68e and try to find ways to reprogram the thing more efficiently! :-)

Michael

I have collected (and made a few) about 24 different maps of
Illinois and surrounding areas, written up a maplist.il for those maps,
and uploaded them all in a file call ILMAPS01.ZIP to both my BBS and
ARN BBS.

If someone would be kind enough to upload them to TAPR.ORG
for others to gain access via internet, it would be appreciated.

I have a PacComm Tiny-2 MK-2 TNC for sale.

It is less than 6 months old. Has the new ROM, works directly off of GPS/LORAN.

This unit is surplus to my needs at this time.

Have all manuals and docs for the TNC.

Price \$100.00 or best offer. Also have PacComm HSP cable for \$20.00

Bob, I made the change to put the /R and /P fields immediately following the /T field, but I found that your weather report parser is more "fixed format" than that; I had moved the /B barometric field out of the middle, and put it first... I now display "998" for the temperature!

So, despite having specifiers in front of variables which should be enough to allow for flexibility, I now know that the following MUST be in this order for APRS to work:

/cse/spd/T000/R000

I also have /P and /B fields I'm broadcasting - where can I put those on the line, so that APRS won't burp?

1995 ARRL Digital Communications Conference
September 8-10th, 1995
Arlington, Texas (minutes from DFW airport)

***** PAPERS DEADLINE July 21st, 1995 *****

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. If you know of someone who is doing great things with digital communications, be sure to personally tell them about this! Papers are due by July 21, 1995, and should be submitted to Maty Weinberg, ARRL, 225 Main Street, Newington, CT 06111 or via the Internet to mweinberg@arrl.org. Please contact Maty for detailed format requirements.

Full text is available on the Internet:
FTP: ftp.tapr.org WWW: http://www.tapr.org/tapr E-Mail: tapr@tapr.org

The ARRL Digital Communications Conference is an international forum for radio amateurs in digital communications, networking, and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communications Conference is not just for the digital elite, but for digitally-orientated amateurs of all levels of experience.

The 1995 Digital Communications Conference will be held on September 8-10th, 1995 in Arlington, Texas. Arlington is just minutes away from the Dallas/Ft. Worth International Airport, which is located in the middle of the country, and airfares have never been cheaper for this

conveniently-located conference.

In addition to the presentation of papers on Saturday, two workshops will be held during the conference. On Friday, Keith Sproul, WU2Z, will hold a workshop on APRS packet-location software. Keith is the Chair of the TAPR APRS Special Interest Group, developer of the Macintosh version of APRS, and a leader in the area of APRS technology. This is a unique opportunity to gain insight into this fast growing new digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning Satellites). On Sunday, Dewayne Hendricks, WD8DZP, will conduct a workshop focusing on a survey of Personal Communications Systems and their applications and use in the Amateur Radio Service. Dewayne is an expert in the area of commercial wireless systems; his company WarpSpeed Imagineering, focuses on wireless Internet. This workshop presents an opportunity to learn how Personal Communications Technology (handheld and small business wireless systems) can be used in the amateur service.

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road, Tucson, AZ 85749-9399. Phone: (817) 383-0000. Fax: (817) 566-2544. Internet: TAPR@TAPR.ORG <http://www.tapr.org/tapr>

Sincerely,

Greg Jones, WD5IVD - President, Tucson Amateur Packet Radio
Dave Wolf, W05H - President, Texas Packet Radio Society

Bob:

Apparently there never have been any detailed road maps of Colorado in PC format. There are Mac maps, but no PC.

The few persons playing with APRS here in Denver area on PC's have confirmed that they also have found no detailed PC maps.

I have not figured out how to get the I-25 corridor from Ft. Collins to the north to Pueblo to the south from the regional maps you refer to. I guess Denver falls off the edges of all the maps! Or, something went wrong when I tried to download "Central" maps. The CODENVER.MAP appears to be, and is reported to be by the other users, the only PC map available, and is the one I remarked on as unuseable.

Our Edge Of Space Science (E0SS) balloon trackers use the MAC maps,

and they are fine. Good road detail down to the local street level. We have a launch coming up the end of the month so maybe I'll get more info then.

FYI the Denver Public Works Department is "testing" a APRS type system to keep track of their trucks. Unfortunately the real estate plot maps of downtown Denver appear to have errors of closure from years ago. DPW seems to have a system running that gives them the correction for GIS that allows them to find these 15 foot errors. US West also has location problems with their valts in the streets, drawings vs. GPS!

The new surveying techniques using GPS have definately shown up the errors on a lot of the old surveys!

At least for now, APRS for tracking vehicles or people at events is on hold until we can find some maps! I'll poke around on the internet to see if I can find anything. The TIGER location is always busy, but maybe at midnight I'll get something that can be converted into something that APRS can use.

RUN Copy the data into a DOS text file. Then run GPStoHST.bas to convert NMEA data to the APRS track history format. Then simply call up that track history file within the MAPFIX.bas program using the alt-G command. Then draw new roads over the pink plotted circles of the track history.

I believe the GPStoHST.bas is looking for GGA data, you may need to modify the parsing in it if you are using RMC. DOES ANYONE WANT TO FIXUP THIS PROGRAM TO BE MORE UNIVERSAL, AND USER FREINDLY???

27. FIX TOO MUCH JUNK ON SIG

From: DDOBBINS@aol.com
Date: Mon, 3 Jul 1995 17:10:54 -0400
To: aprssig@tapr.org
Message-ID: <950703171027_107248993@aol.com>
Rendered body type: text/plain

I'm about to UNSUBSCRIBE from my favorite SIG. Here's why:

- There are alot of message responses to specific inquiries being answered to the whole SIG, vice just the person who made the inquiry. Results: Lots and lots of responses that I have to IGNORE, which takes 3-4 mins a day flagging them one by one.

I don't want to leave, but know many of you are experiencing the same dilemma. I'll bet those who have UNSUBSCRIBED, if queried, would tell you the same reason.

Recommendation: Let's not flood the SIG with too many responses. Direct your

response back to the originator of the message, vice the whole SIG. This is going to take the effort of all, but it's an easy effort. Please help. Otherwise, it's been nice knowing you, but I just don't have the time to spend on the SIG everyday, especially when it's time IGNORING messages. Too bad, I really enjoyed the comments on APRS in the sailplanes, and other interesting uses.

Aloha, Dave, WH6YC, in Hawaii. APRS on 145.05, digi thru AH6CP-1.

Rendered body type: text/plain

What you're asking for is NOT something wasily done. A large percentage of the users of the "sig" (it's actually a listserver, but the BBS folken are unable to comprehend that) fail with great regularity to include their e-mail addresses. Further, TAPR has elected, improperly in my estimation, to modify the headers in the listserv parameters, so that a valid Reply to: RFC822 (and subsequent modifications) header is either discarded or changed to direct all replies back to the group. That makes it a real pain to track down some of these folks, who may not have a real internet address, anyway.

You haven't got a proper name in your header. this has the serendipitous outcome of allowing me to find your e-mail address. Actually, I'd prefer this error to the header rewrite fubar.

And, really, to some extent I must agree with you. There are a number of folks who reply with info that is either untimely, or incorrect. Or repetitious. I've been known to send "old" info, but I tend to see >150 messages on a good day, and frequently more than that.

73, gerry

This is not a flame and please don't flame me, but...

APRS is such a multi-faceted program, there are going to be topics that pass through the SIG that are not of interest to everyone, but I vote that answers to inquiries NOT be posted back to the originator-only. Those responses are of interest to everyone experiencing "that" particular anomaly with the program and a "general" answer via the SIG helps alleviate the same questions from multiple users.

It may be that any ONE person might not be happy with ALL the stuff, please don't take it out on any of the rest of us just because that person doesn't have the time to handle certain messages passing through the SIG. This is all good stuff. I think there are message parsing programs that can expediently eliminate unwanted messages.

I, for one, am interested in learning more about RDF'ing, but haven't yet dug into it. I'm heavy into MAPS, GPS and WX, but I still want to see what all the other hoopla is about! I agree that personal replies should go directly to the originator, but I enjoy seeing the other generic stuff.
^^^^^^^^

I reply to this message in the kindest of terms... I mean to offend no one... no yelling... only MH0! I had to say it... Thanks for listening. 73

I disagree - the equivalent of making "private" replies to questions INCREASES the number of repeats of the question - "No one ever answered so-and-so when he/she asked this". Plus, there are a LOT of people who subscribe to lists, as well as join forums/roundtables/whatever on various services, who NEVER post messages. They still want answers to their questions, though, and get them by reading messages directed to others who had the "nerve" to post their questions.

I administer a forum on CompuServe, and the ratio of "lurkers" (who rarely or never post messages) to "active participants" (two or more message per month) is in excess of 100 to 1; TRULY active members (10 or more messages/month) are 1 or 2 in a THOUSAND. But, forums are VERY valuable; in many, I get sticky questions answered simply by reading the already-posted messages.

True, a mailing list doesn't have the persistence of a forum (messages last here as long as it takes to transmit them, vs. 2 to 60 days on other services), but reading the traffic can get most problems addressed within a week or so.

I have to agree with Dave. The APRSSIG is taking up the majority of the mail I receive. I've come close on several occasions to unsubscribing. Many of the questions have been asked before and many of the responses are the same though from different people. Although this is good for newbies trying to learn, it adds up to a lot of mail I end up deleting without ever reading.

Dave's solution would keep people who might be interested in the reply (say for help on mapfix or something) from getting useful info. I think a better alternative is to migrate to a newsgroup. Maybe rec.radio.aprs or something. That way responses would be grouped under a particular topic.

Comments?

I am new to APRS but am experienced in the world of the internet. A good solution to repeated questions is to create a FAQ (Frequently Asked Questions) Mailing and post it to the list about once a month. This allows most duplicate questions to be answered in one mailing. Also the FAQ can be mailed directly to the person without worries that anyone is missing something, while maintaining list cleanliness. When the FAQ comes out, regular subscribers can just delete the one message per month and not the hundred or so that rehash the same topic.

More as it happens...

In a message dated 95-07-03 23:12:21 EDT, you write:

>I disagree - the equivalent of making "private" replies to questions
>INCREASES
>the number of repeats of the question - "No one ever answered so-and-so when
>he/she asked this". Plus, there are a LOT of people who subscribe to lists,
>as
>well as join forums/roundtables/whatever on various services, who NEVER post
>messages. They still want answers to their questions, though, and get them
>by
>reading messages directed to others who had the "nerve" to post their
>questions.

My vote is leave it the way it is. AOL's FlashSessions let's me download the whole day's mail in less than a minute. I can read all the mail offline. I can delete what I don't want to keep.

And as I get further into APRS, I can go back to mail on past subjects that I have questions on.

And one of these days I may get a Mac...and that'll give me a whole new batch of mail to read. :-)

barry

Anybody had any luck with getting this digitizer to run with MAPFIIXER? I picked the one that I have up cheap at a hamfest but no docs -- do have utility programs but can't seem to get it to talk to the maps program. Any suggestions welcomed!

By the way, in regard to too much traffic on the list, I learn a lot by \reading replys, and it doesn't take long to download them from my server -- running OS2 and PMMail -- I could see people having problems if they had to stay connected and read each one. Anyway, the FAQ idea sounds like a good one, but I would just as soon see the format here remain unchanged. Thanks to all you knowledgeable folks who take the time to conjure up answers for those of us who don't know 'em! 73 all de Geep WA4RTS in Lynchburg VA

38. Power Height Gain

Bob- Some confusion is going on in our local area. Many users are posting PHG figures of 1280 ft. They seem to think that the H in PHG is for height above SEA LEVEL. Isn't it supposed to be height above average terrain? Pls clarify this.

Our height above Sea Level is approx 1000 ft. When they have a small hill and tower of, say, 200 ft or so, they should enter 200 ft or so- correct? NOT 1200 ft?

It would really help if you would write something to explain this better. If you post it here, I'll pass it along.

These guys have range circles that are gigantic. Even larger than the WIDE digi nearby!

Thanks- Ralph

> clarify this.

REPLY: Yes, it always amazes me how any HAM can think that Height above SEALEVEL means anything of value. It is HAAT which every VHF user should understand, and if he doesn't, then explain it to him, hi hi. Although saying "it's the height of your antenna tower" is closer, there are still idiots with 50 foot towers down in valleys that think their HAAT is 50 when in fact it is BELOW ZERO!

Good luck, hi hi. People with incorrect PHG are doing the net a disservice by confusing the laws of propagation, hi hi. Again, the PHG display is only a first order approximation assuming a relatively smooth earth. People that have obstructions and hills should further reduce their HAAT or offset the circle in the opposite direction to give the best possible match to known propagation. If you CANNOT hit other stations which intersect YOUR circle, then your CIRCLE is too big.

If their circle still does not match reality, then tell users to reduce the circle size (height) until it does.

About HAAT.

You'll probably find that most amateurs haven't been exposed to calculating HAAT (unlike some of us old repeater builders - yes, I'm guilty of building a couple of 'em, but it's a long time ago now [16 years ago and they're still running]). I believe there's still a piece on this in the ARRL Handbook. You might explain this some more in your doc files, Bob, or refer them to the ARRL reference..... It involves running out 8 lines and marking HASL at various distances and then subtracting the average from your HASL and hopefully getting a positive number!!!!

My HAAT is about 3' and so is my HASL! <(:-)

If you're wondering, the < on top of my smiley is my Trimble Navigation baseball hat - keeps the sun off my bald head when at sea!!! Also, it's neat on shore for impressing the "chicks"..... it has a nice elaborate woven design in it.

### 43. Use KAM Host mode?

From: jeff.brenton@espi.com  
Date: Wed, 05 Jul 95 14:51:23 -0500  
To: aprssig@tapr.org  
Message-ID: <9507051451.0KVCf05@espi.com>  
Rendered body type: text/plain

Watching APRS's status line, I see a lot of times when it has no idea what the state of the TNC is, hence it sends commands to disconnect when it isn't connected, or come out of converse mode when it's already in command mode, etc.

I have to deal with this, because I'm trying to feed APRS from a dual-port TNC, where the TNC is actually under the control of another computer; I just translate APRS's requests into Kantronics Host Mode strings, and Host Mode replies are translated into something APRS wants to see.

My suggestion is, why not take advantage of Host Mode, when available? It's simple - the commands are the same, except for having a header that says, "This is a command", and data has a header that says, "This is data, it is to be directed to this port, and it is for this channel (or unproto)". All Kantronics TNCs with semi-modern ROMs support Host Mode; it's been out since at least 1988.

Here's the jist of Host Mode:

All data/command blocks start with a 4-byte header, beginning with a FEND character (\$C0 in TAPR parlance). Next is either a 'C' (command) or 'D' (data) byte. Third byte is either '1' or '2', for the port. Fourth byte is the stream to use on that port - '0' means send it UNPROTO. You then put in the same data/command string you'd normally send, with a trailing FEND (\$C0) byte added.

Coming from the TNC, the string is \$C0, a status byte ('C' means this is a result message from a command, 'D' is data from a connected stream, 'M' is "monitored" [unproto] data, and 'S' means a connect status change), the port it came from ('1' or '2'), and the stream ('A' through 'Z' or '0') that it came from), then the same string that is sent in non-host mode, followed (again) by a \$C0 byte.

In my program, the switch from using "regular" mode to "Host Mode" involved just adding the header and trailer to the existing data being transmitted. I don't know if Bob or Keith want to "customize" their programs to Kantronic's Host Mode this intimately, although I would suspect that the AEA Host Mode is similar - only the lead-in and trailer strings would be different.....

The command to change MAPLISTS is the FILE-CHANGE command. Sorry, it is NOT in the MAPS menu... there was no room for it there.

### 45. BETA test of 7d

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Wed, 5 Jul 1995 19:04:18 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950705182423.6829E-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

This is NOT a finished release, but since I put it together, I figured I would post it on TAPR for ftp. It will NOT be on ARN BBBS, since it is just a beta test. A DF user in Calif finally hooked everything up and discovered that enabling GPS HSP mode overrides the DF interface, making it impossible to use APRS as a fully automated DF/GPS mobile unit. APRS7d fixes that. So now you can have a GPS input to your automatic DF mobile station. (TNC and GPS HSP on one port, DF on the other).

Also included in 7d is an attempt to permit different messages to use DIFFERENT DIGI paths. I was all excited about this, until I got it running and found out the following BIG problem:

A TNC (or at least the one I was using for testing) does NOT add the UNPROTO path until the INSTANT of transmission. This means that I can set up an UNPROTO path that is unique for a message, but I have to KEEP THAT UNPROTO path unchanged until AFTER the message packet is finally sent. This is an INDETERMINANT time, since the channel maybe busy and who knows how long until the packet is finally trasnmitted. SO I cant just change the UNPROTO, send the message line to the TNC, and then changee the UNPROTO back again. Also, for similar reasons, changing the path for ACKS is almost impossible.

So here is the way I implemented it:

1) If you use the SEND command, and enter W3XYZ/XX for the callsign, then APRS will scan the OPS-DIGI-LIST for a path to XX. If there is a path labeled XX, then that path will be used for THAT message.

2) I had to slightly change the format for saving the OPS-DIGI paths. So you will have to re-enter them with a SPACE and the word VIA prior to the digi list. IE: XX VIA DIGI1,DIGI2,DIGI3, etc.

3) Due to the problem noted above, the new path to XX will remain in the TNC, until the next scheduled transmission of ANY other packet from your station. If less than 5 Seconds has elapsed, AND the new packet is supposed to go somewhere else, then you will be put into a 5 SECOND DEAD HOLD to give time for the previous packet to hopefully be sent. IF it takes more than 5 secs for the packet to get transmitted, then you will see it probably go to your main path instead of the intended one.

SUMMARY: I live in the middle of 12 digipeaters. I see stuff from both ends, but until now, could only TALK in one direction or the other. With this capability, I can have my UNPROTO path set to the north east, but still have an outgoing message to a guy in the opposite direction. Of course my ACKS only go the main way, but whenever I get an incomming message from someone, I change my main path to his direction to be sure he gets an ack. And for my new dual direction outgoing messages, the assumption is that the receiving station is probably already sending things my way, or I wouldnt see him on my map.

If you can understand an live within these constraints, then you might find the /XX ability useful. But if you have 4 outgoing messages in 4 different dierctions, I guarantee you, that the 4 x 5 second DEAD DELAYS will not be pleasant. So use this feature with intelligence and caution. If you have 4 messages going one way, and 4 the other way, be sure to send them in a row. That way, there is only ONE shift of UNPROTO between the first 4 and the last 4, rather than 8 shifts at 5 seconds each!

Ignore the ALTPATH option in the OPS-DIGI menu for now. It is going to give you an ALternate UNPROTO path for your beacons and posits. BUT it is not finished, and does nothing.

So, since my TNC and serial port got fried in the last thunderstorm, Im gonna let anyone that wants to play with this multiple message rougin option give it a try. Feedback is welcome...

Particularly if you can determine if your TNC stores the UNPROTO path at the time the UI frame ENTERS the TNC, or when it is TRANSMITTED. To test this, use any terminal program, open up your squelch so your TNC sees carrier detect and holds off transmission. Then enter an UNPROTO path, enter a UI packet, then enter a different UNPROTO path, then close the squelch so the pakect is transmitted and see which UNPROTO path is used. To make it easy to see, use WIDE,NORTH and WIDE,SOUTH as your two paths so that your WIDE always digipeats it so you can see it.

From: jeff.brenton@espi.com  
Subject: [APRSSIG:2067] Use KAM Host mode?  
<snip>

My suggestion is, why not take advantage of Host Mode, when available?  
<----- End Included Message ----->

Host mode would also make it easy for APRS to allow connected QSOs instead of unproto QSOs, WITHOUT LOSING ANY POSITS during the connection! Multi-connects are even easy with Host mode. We could use a specific function key to jump from QSO to QSO or back to the map.

Any comments Bob?

## 47. ILmaps01.zip caution

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Wed, 5 Jul 1995 21:54:55 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950705205718.7200B-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

I just unzipped ILmaps01.zip that was posted on tapr.org and found that it contains duplicate copies of many of my standard dsitro maps. Be sure to unzip this file into a separate directory and compare maps before placing them in your APRS system.

To solve this problem, I have removed the duplicate maps and re-packaged the group as ILmaps02.zip. It will be in the proper configuration for unzipping with PKUNZIP -d.

This re-emphasizes the guidance in README\MAPS.TXT on how to properly organize and zip up a state distro so that it does not cause confusion and problems. Good luck.

Hi Dave DE Sam KB7QQQ.

I live in Puyallup about 40 miles south of Seattle. We have a net started here but we have aonly been going for about a month and have lots of problems to work out. We are trying to develop GPS tracking for Search & Rescue in Pierce County (and hopefully all of Western Washington)

We are currently using 145.090 but may have to move this as more people come into the net. It is also a BBS freq. We have 5 or 6 regular operators in Pierce County and one in Kent and one in Bellevue. When I am mobile I use the call KB7QQQ-2 as it does not put up the car and take up so much space on the map.

The WASOUND maps are great but not very detailed. WE are working on improving these. Most evenings we can be found on 146.460 simplex and I also monitor the Pierce County Emergency Repeater 145.370 - (136.5).

Will be looking forward to you showing up on our maps.

## 57. DF SINGLE PORT MODE!

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>

Rendered body type: text/plain

Well, I finally have a person testing the DF interface (tony) so I did a little work on DF (and added a few features useful for mobiles in general too)

I added a DF single Port mode (DFSP)...! (not posted yet, cuz tony has a dual port and doesnt need it, so Ill keep testing until someone else is ready to go with the DF/GPS/HSP combination.

The only problem is that it will require modifying the N7LUE interface from 2400 to 4800 baud to match the GPS and TNC in HSP mode. I dont have a schematic of the N7LUE interface, so someone needs to figure that out... I guess it might work at 2400 if you have a GPS that can change to 2400 to match. (TNC also).

In the process, i added a INPUT-SAVE-my command so that when you do get a good fix, you press tha one command and it copies your posit (with DF info) into an OBJECT so that it stays PUT on the map while you keep going. This way, you can drive to three or more locations and retain all previous fixes on the map for triangulation (not realllly needed witha DF unit, but the command is in general a good addition for just marking posits while driving.... Also added F8 key to force an HSP update at anytime. Useful for getting a POSIT just before a DF fix....

This is exciting! But boy is it getting complex!  
The DFSP mode adds a DPDT push button switch to temporarily switch in the DF unit for a fix (about 5 seconds). It can be wired to a back-to-back pair of DB-9's so that an unmodified HSP switch can be used with or

without it. We need some beta testers...

Since we still dont seem to have any real full time Doppler DF'ers on here, if anyone knows of any rabid DFers that dont know about APRS, then let them know that the maps are a'waitin! Is there a DF SIG somewhere that could use a little APRS advertisement?

---

## 58. 7d BETA Problem

From: W2H0B@aol.com

## 59. KPC-3 L TRACK Buffer

From: RonN9QGS@aol.com  
Date: Thu, 6 Jul 1995 22:31:46 -0400  
To: aprssig@tapr.org  
Message-ID: <950706222626\_109513580@aol.com>  
Rendered body type: text/plain

Hi, I believe I am setting up the L Track command correctly by specifying my maildrop as N9QGS-1 and setting its size to 50K and the setting my Ltrack to the correct sentence and the size, i.e. 20K. But how do I retrieve this? I thought you connected to your mail drop and I did the command specified by the help menu , and it just gives me the last recorded sentence???! Isn't it suppose to list a whole bunch? Your help is appreciated, If it worked correctly I should have a whole trip I did on a balloon launch.

Ron

## 61. SPACE APRS EXPERIMENT

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Thu, 6 Jul 1995 23:33:42 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950706230616.15670B-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

There may soon be an opportunity to test APRS as a ground station plotting tool during an upcoming space event. In this experiment, APRS stations will be permitted to transmit UI frames for digipeat via a space borne TNC digipeater. If this experiment is successful, it may be used to encourage the use of APRS type UI position reports from schools participating in the AMATEUR SATELLITE program. Reception and plotting of short single packet UI position reports could not only be a more efficient use of a space borne TNC, but could also improve the visualization of packet radio to students. For a more indepth discussion of this application, see the APRS\README\SPACE.txt file included in APRS.

NOTE!!! This opportunity will be LIMITED TO LISTED MEMBERS of the APRSSIG Special Interest GROUP ONLY. This restriction is necessary to have a known and measurable baseline of stations, and to also permit a

channel for INSTANT feedback and control of the experiment. This PRE-announcement is being made to encourage APRSSIG members to familiarize themselves with the techniques and operating procedures outlined in the SPACE.txt file.

Particularly, it is important to make your packets as short as possible. This is easily accomplished with the alt-SETUP-MODES-GRIDSq mode. In this mode your grid square is placed at the beginning of both your BEACON and POSIT. In APRS7b there is an additional SPACE mode which will sound an ALARM if your packet is successfully digipeated.

PLEASE TEST AND BECOME FAMILIAR WITH THE grid square and SPACE modes in your particular version and how to control your transmit rate. Once the test begins, our objective is to see a successful digipeat of our posits. Additional messages, objects and bulletins are NOT encouraged.

REPEAT: To make this test a measurable experiment we ask that you keep discussions of it within the SIG for now. Watch here for more news when it becomes available!

=====

Setting the buffer storage inside the TNC to save the GPS data.  
Do only once before getting data, as I think this clears the

buffer.

LTRACK

LTRACK 5 LT1 LT2 LT3 LT4 or

LTRACK 5 LT2 for only saving the LT2 data which is \$GPRMC per  
my GPSHEAD setting.

With the standard 32K of memory 17 is the largest I could set this value.  
Note the data is stored in the buffer at the rate set by the BLT beacon  
command not the rate  
the GPS sends data to the TNC.

INTERFACE GPS when the TNC is next powered off/on it will stat  
in GPS mode.

INTFACE {TERMINAL | NEWUSER | BBS | KISS | HOST |  
GPS}

I also use the Software CD setting.

CD SOFTWARE

-----  
How to READ GPS track DATA from the TNC buffer:

login to the TNC BBS as callsign-1

LTRack n [string] DISPLAY LAST n MSGS IN TRACK BUFFER

LTRACK 50 Read 50 lines of data from the buffer

LTRACK 50 \$GPGGA Read 50 lines of \$GPGGA data from the buffer.

The data is dumped back in LIFO format (last in first out) that is it is  
backward of

what you are expecting for a trip log when you play back using APRS.

-----

The other settings you must do to the kpc-3:

Setting for which NEMA sentences you want to record or beacon  
You get to set up to 4. I use only two

GPSHEAD  
1 \$GPGGA

```
2 $GPRMC
3
4
```

The LT buffer filled with real GPS data

```
LT
1 $GPGGA,064301,3250.743,N,09645.669,W,1,05,2.6,236.7,M,-24.8,M,,*71
2 $GPRMC,064303,A,3250.742,N,09645.668,W,002.4,121.2,040695,,*06
3
4
```

The LT buffer when the GPS is not seeing any satellites.

```
LT
1 $GPGGA,100552,,,,,0,00,,,M,,,*65
2 $GPRMC,100551,V,,,,,,020695,,*39
3
4
```

Setting the beacon time for the GPS data

I use \$GPGGA two times a min and \$GPRMC once a min.

Note the offset so RELAY stations have time to respond

```
BLT
1 EVERY 00:00:30
2 EVERY 00:01:10
3 EVERY 00:00:00
4 EVERY 00:00:00
```

Setting for the output APRS format

```
LTP
1 APRSM VIA RELAY
2 APRSM VIA RELAY,WIDE
3 NONE
4 NONE
```

Hope that helps.

Bob kc5ejk@onramp.net or kc5ejk@amsat.org

Rendered body type: text/plain

Re: Garmin GPS-45, a phenomenom.

I've been driving around the city with a GPS-45 mounted in the car for a  
couple of weeks now, and have found a "dead" spot where the receiver  
consistently loses track of all of the satellites. This usually produces the  
error message: "Power down and re-init", but if I go through the "dead" spot  
quickly enough it might just say "Poor GPS coverage". This "dead" spot is in a  
completely open area with a very good view of the sky in all directions. There  
is a high voltage power line running through the spot and I've tried to blame  
the problem on it, but under the same power line a quarter to half mile away  
there is no problem. I guess it MIGHT be a noisy/dirty/leaking insulator or  
something on a particular pole, but I can't be sure. I think L-Band is  
somewhat high for insulator noise anyway, but I'm sure not an expert there.  
The spot seems to be maybe a couple of hundred yards long in the dimensions I  
can drive in. It is located on the south side of the TI expressway property in  
Dallas and laps into the IH635 freeway running just south of the TI property.

## 70. Help with KPC-3 setup

I just got a KPC-3 ver 6 TNC today. Can anyone out there that is running one please give me a list of the GPS setups. I'm not sure about all the info in the manuals.

Some of the question that I have are about the new commands. Do they take the place of the old ones or are they used together. i.e. unproto path, beacon times and beacon text are just a few of my concerns!

Any help will keep me from reinventing the "Wheel"

Will be using a PVT-6 and a HT with the KPC-3.

Thanks in advance.

To: aprssig@tapr.org  
Message-ID: <9507080114.01QY908@espi.com>  
Rendered body type: text/plain

Claude Head asks about a "dead spot" for his Garmin 45 near the TI plant in Dallas; the symptoms are consistant with a noisy area. Remember - the satellite signals are "spread spectrum", and the computer in the GPS is reconstructing it. The signals MAY be below the "noise level" of the background radiation, and still produce a "solid signal" after processing.

LORAN works the same way - as long as the signal-to-noise ratio is high, the signal level might be very low. My Apollo 604 will report SNRs of 150-220 out of 255 possible, with SigLvl reporting zero or 1.... or, it might have SNRs of zero, with signal levels in the 20-50 range, if I'm near power lines (many utilities send data across their long lines on a 100KHz carrier, which just happens to be the frequency used for LORAN).

> computer in the GPS is reconstructing it. The signals MAY be below the  
> "noise level" of the background radiation, and still produce a "solid  
> signal" after processing.

Jeff's completely correct, and I dropped the ball. By raising the noise floor, a spread spectrum signal has to have more signal to be decodable. In a random (gaussian) noise environment, the noise amplitude can be raised higher than in a non-gaussian or pink noise environment, like that generated around a power system. Further, you could be seeing an "antenna" effect, where a long stretch of power line is capturing and reradiating a variety of signals, all the way up to L band.

A final consideration, and one that cannot be discounted, is that the power lines are reflecting the signal, providing a multipath environment, and making the timing solutions indeterminant. At that point, the GPS will decide it's not happy.

On another topic... Did anyone notice some strange satellite performance Thrusday afternoon, about 1930-2300 utc? I was out with some high-\$ Trimble survey-grade gear, a Garmin GPS-55 and a Motorola VP OnCore, and they were all giving wierd solutions.

## 73. HF gate's again

I know you guys probably hate to see this again Hi, but again this morning all i can see is HF gates all over the map. Now i entered a Gate,Wide to see what would happen and up pops a little window saying that "GATE was designed for HF Boats and Mobiles to relay their position back home on VHF". Sorry but out of the bunch i see on VHF NONE of them are running mobile or are in boats. Bob in order to prevent these unwanted gates on our maps (More so the messages and beacons) we need to have a version of APRS without them being able to do this, Why should we be forced to except all that traffic if we don't want it. We don't care to see or hear them if we can't communicate with them!. I know guys i again will get some flame for this, but remember All of our local users would rather have the HF gaters go away.

-- [ From: Robert D. Swain \* EMC.Ver #2.10P ] --  
 Expanded recipient data:  
 cc: Jerry T. Swain                    \ PRODIGY:        (CMPK59A)

In response to the message posted by Bob Bruninga, WB4APR :

> The only problem is that it will require modifying the N7LUE interface from 2400 to >4800 baud to match the GPS and TNC in HSP mode. I dont have a schematic of the >N7LUE interface, so someone needs to figure that out... (WB4APR)

Here is the modification required to change the N7LUE Doppler Interface board to 4800 baud:

1) Locate U3 (8116). With power off, locate and cut the trace that connects pin 14 to ground. Replace it with a jumper that connects pin 14 to pin 13 (+5v). This changes a logic 0 to a logic 1 on pin 14.

2) Still on U3 (8116), locate and cut the trace that connects pin 15 to +5v. Replace it with a jumper to pin 16 (ground). This changes a logic 1 to a logic 0 on pin 15.

The above changes will allow the N7LUE interface board to send data to APRS at 4800 baud.

Version 2 of the interface will incorporate this change by allowing

jumper selection of baud rates.

Subject: (U)Beacon Positions  
Bob, I have persuaded the local bbs stations in the area to put their locations in their beacons BUT not much success. The first problem was that they borrowed my Garmin-45 to get their positions and insisted in putting their locations in to 3 decimal places instead of 2. Got that cleared up but still no joy. I got it to work after I removed the colon in the TIME from one of them ( they start the beacon - which is to MAIL - with a date and a time e.g. 8-Jul 15:20 - they are using FBB) I guess the colon screws up APRS parsing - is that the problem?.....Keith YB5AQG

## 77. Version 7.1 bug report

From: lbutler@awod.com (Larry Butler)  
Date: Sat, 8 Jul 1995 20:30:16 -0400  
To: aprssig@tapr.org  
Message-ID: <199507090030.UAA08429@sumter.awod.com>  
Rendered body type: text/plain

I have a problem with 7.1 that I never had before, even with 7.0d.

The CFG71.APR file isn't compatible with the KAM. And I don't think 7.1 is reading the data from the file correctly. My config file is at the bottom of this message (if I don't goof it). I put in, using  
O D S WW,GATE,WIDE,WIDE/APRS V WIDE,WIDE into the DIGIPATH and saved it to CFG71.APR which, for some reason, always has corrupted my root directory. It shows up in the file as I typed it. The file has been saved correctly. When 7.1 reads it out of the file, it shows up in the TAB status window properly...showing me the file is being read into the program correctly. BUT, if I press U the only thing I see is WIDE,WIDE on the U command's screen. If I type GATE,WIDE,WIDE/APRS V WIDE,WIDE into the U command, the program sends this properly to the KAM and the beacon line shows a proper path to both HF and VHF as usual. But somewhere between reading these lines from the CFG71.APR file and the string that is sent to the KAM, it never makes it. Bob??

I also have noticed that the E outgoing message kill command has been changed for the worse! If I had a BLN bulletin line or more onscreen while messaging to someone, BLNs were the LAST to be dumped with the E command. This was great as you could control normal conversations without disturbing BLN lines. NOW, the program dumps the lines in the ORDER THEY SHOW ON THE SCREEN without checking for the BLN status. Only the \*ACK\* lines get dumped first before any unacked text. If I have a BLN line above text that isn't making it to a destination, I can no longer dump the undeliverable lines without dumping the BLN lines first. I'd like to see that changed back OR...more preferably...I'd like to see bulletin entry on the bulletin screen DIRECTLY. This would eliminate mixing BLN lines with message traffic on the single screen. I would also hope doing this, in a different array perhaps, would keep the BLN lines from sucking up my 10 line limit on message traffic. If we ever do get into a bad situation where we are in actual emergency comms, this 10 line limit is gonna kill using APRS for any message traffic...especially if 5 of the 10 lines are taken up with a bulletin necessary for all stations to see. Bulletins need to be off the message screen....OR.... We could REALLY INCREASE TRAFFIC WITH TONS LESS LOAD ON THE CHANNEL if APRS actually connected, like regular packet, to the

station you had messages for. This will work with MCON ON. Connected packets, even through digi paths GATE,WIDE, are FAR less lengthy than these long, long beacons. APRS could see the same data, i.e. :KN4IM : followed by the data. APRS would parse the ':'s out of it and display it on a message window as it does now. How 'bout it, Bob? Input would still be the same as it is now, but APRS would initiate an HF or VHF actual connect to the destination. Then, it would do similar parsing to recover the call and do the display. The retries would go down 100%!

Enough horn blowing...that's my bug report and suggestion box...

## 79. O-D and Config bug

From: lbutler@awod.com (Larry Butler)  
Date: Sat, 8 Jul 1995 22:27:30 -0400  
To: aprssig@tapr.org  
Message-ID: <199507090227.WAA10368@sumter.awod.com>  
Rendered body type: text/plain

Bob, I found that my 7D does the same thing as 7.1. My 7B works fine in the path department. I can O D WW and transmit then O D NO and transmit and the path is correct on both HF and VHF.

The configuration loading into 7b also works fine but not in 7D.  
I hadn't noticed it until backpedaling to previous versions looking specifically for this bug.

Hope this helps!....

Er, ah, while we're at it...Can APRS be taught to look at the call in the position array and reject it if cmd: is part of the call?? That would eliminate it from putting extra cmd:KN4IM or some other call it sees when commands are sent to the tnc, as it does when O D is selected. Thanks!

73, Larry KN4IM

>history file with mapfix to create a map. It would be a lot more convenient if  
>I could leave the laptop at home on sorties through the jungle!  
>

Someone told you how to use GPS2HST.BAS to convert the file, but I don't think anyone told you yet how to download the info from the Garmin. There is a newsgroup (sci.geo-satellite or something like that) that dwells on this type of stuff, but I'll tell you here because there may be others interested.

Garmin sells their nice little \$140.00 program to download/upload files to the Garmin. A guy on the newsgroup has written one as well. It is a DOS program and is called GARDOWN6 (It is sort of like APRS, the author is constantly improving it). Get it from my FTP site if you can FTP.

The address is ftp.mindspring.com/users/rwf/gpsstuff. I think that should work for you. If not let me know. There is also a link to the GPS stuff

from my web page: <http://www.mindspring.com/~rwf>

Let me know if you have any problem- sometimes I get confused on my own ftp address.

It seems to me that a local user would have selected a local map which would not paint the wider spread GATE data. That being the case, how can gated sigs be any annoyance?

As a local user, I find that GATE inputs provide some variety to an otherwise somewhat static display.

If Bob opts for the suggestion to eliminate GATE reception, I trust that he will make it an user option.

Rendered body type: text/plain

Bob, I just installed ver 7.1 and there are some strange things going on here.

I did make note of the change in digi path storage, and I see the comma after the space, ie DR, VIA WIDE,GATE/APRS VIA WIDE,WIDE, is VERY important, yet the saved paths still aren't working. I put in the two letter code I have chosen and a different path comes up than the one I intended.....

Secondly, the bulletin screen is cutting off the first few letters of each line, examples from my current screen are:

KN4HX-1>BLN1can do with fewer advertising messages via ham radio!

KR4US> BLN1 S 7b to 7.1 UPGRADE now on the CATHOUSE BBS

KU0G-1> BLN1 now posted on Jambalaya (816)628-5776!  
KU0G-1> BLN2king for stuff for APRS ENew for 715 issuance. Pse send notes

etc, etc...

My system uses a KAM all mode with vers 5.0 firmware and a 486 machine...no other connections.....any clues?

Keep up the good work....

Rendered body type: text/plain

Well, I finally went GPS/APRS/DF mobile yesterday with no less than N7LUE as a navigator! (My wife was outtta town with the kids). The fox was 8 miles from starting point and we got there in 31 minutes with 12 miles traveled. ( a simple local monthly event) BUT it was my first DF hunt in 15 years, and we were just playing, but I was testing new features in APRS (now that one person reports that he has all the interfaces going and I now have a beta tester!) Anyway here is what was in 71 (with bugs) and what will be in APRS71a next week!

- 1) The GPS does very well in giving a heading while moving. I am adding an INPUT-HEADING command so that if you are stopped, then with 4 key strokes you can enter your heading from a compass (magnetic) and APRS will update your true heading. (for proper conversion of RELATIVE)
- 2) APRS DOES properly convert all DF bearings, Magnetic, or RELATIVE to TRUE.
- 3) The new INPUT-SAVE command that snapshots a FIX and places your current posit and DF bearing on the map as a permanent OBJECT for your own reference is a GREAT tool for the BEAM hunters. These saved FIXes can be used to triangulate in on the fox. The INPUT-UPLINK command is the same, but not only puts the FIX on your map, but EVERYONE else's! (Neither of these workd in 71 ARGH!! but is a trivial fix for 71a)
- 4) The DOPPLER operator knows FAR BETTER than ANY computer algoirthm when he is seeing garbage, and when he is seeing good data!!!! He looks out the window and sees buildings or an open field! No computer can match the knowledge of a skilled operator who can see his RF environment. So Joe Moel's suggestion to put a PUSH-BUTTON between the DF data and the COMPUTER is the ONLY way to go. That is the basis of the new APRS DF Single Port mode that lets you operate your TNC/GPS and DF on your one-and-only laptop serial port!

CAVEATS: For a competitive fully equipped doppler DF'er, I'll admit, APRS doesnt really help find the fox, unless there are circumstances where spot triangulation is needed. But BOY IS IT IMPRESSIVE when you replay your APRS track history with periodic DF bearings to show your brilliance and technique to everyone at the finish!

The BEAM DF'er will find APRS a perfect tool for spot triangulation. Using the INPUT-DF bearing command he only types 5 characters for each fix, and APRS with his GPS does all the mapwork. but he will still need a local map to find himself in the real world, and find a road to get from here to there. Again the TRACK HISTORY is an excellent tool for showing off ones brilliance or stupidity.

Even if you just leave APRS in the back seat, Dont forget to use the MAPFIX program and your track history when you get home to UPDATE your current map with all the new roads you traveled...

APRS is the only tool for OMNI-DFing

FOR FINDING A REAL JAMMER, or for any other GROUP HUNT, APRS IS THE ONLY WAY TO GO! With the operator push-button between the Doppler DF and the packet network, we have eliminated the introduction of garbage data, and everyone on the packet net can just read the map and GO!

Stay tuned.

APR REPLY: I just included a first draft of a KPC3.txt in version 71 that was based on some other traffic about the KPC-3. I need a volunteer to become the OWNER and updater of that file to make it answer all the Frequently asked questions about the KPC3.

I also began a GARMN45.txt. We need someone who considers themselves an expert on their particular GPS and TNC to write one for each. I will include them in standard APRS distro, but I cant figure em all out myself. Please make them BRIEF but informative.

> I know you guys probably hate to see this again Hi, but again this morning  
> all i can see is HF gates all over the map.

APR REPLY: I think that Bill has a point. Herre are my suggestions!

1) APRS now has a CONTROLS-FILTER-GATEWAY that will allow your system to ignore anything with GATE in its path.

2) We should limit gates to ONE HOP only. This makes it easy for you to know WHO's gate is messing up your local network. But to do this, we must encourage stations on HF to limit their paths to GATE,WIDE and NOT GATE,WIDE,WIDE.

Once we get all the HF'ers back to using only GATE,WIDE, then any further contorl of QRM will be between you and your GATE operator. He should be willing to turn his gate OFF during your local special events.

OK, OK, I CAN TAKE A HINT! I'll change it all as soon as I get off  
inet. We here in the boondocks used GATE,WIDE,WIDE to spread the APRS  
virus as far as possible. GWW let users on VHF in NC see the data/fixes  
coming thru my GATE here in Charleston, to my WIDE 20 mi N and thru  
Hickory NC's WIDE at 4000 ft. Sorry if we QRM'd anybody...(snif).

>  
Let me ask a stupid question...

If you don't want any GATE data on your local network, why not just  
change the name of your gateway to something else? Then if there is  
a special reason to put something through your gateway, all a body would  
have to do is put your specific gateway call in their path! Example,  
if the gateway were in Atlanta, didn't want to see all the GATE stuff  
on their local net but still wanted to be contactable, let their gateway  
be MYG ATL or some other STANDARDIZED DESIGNATOR. Then If I wanted to  
get data into their net, I would use ATL (or whatever) to do it!  
Maybe I missed the point. If I turn off my GATE here, my phone rings  
off the hook..."Is the GATEway down?". Guess we're less picky in old  
Charleston in the technological boonies....hee hee...73, Larry KN4IM

To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950709143047.26087K-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

On Sat, 8 Jul 1995, a user reported:

> I have a problem with 7.1 that I never had before, even with 7.0d.  
> The CFG71.APR file isn't compatible with the KAM. And I don't think  
> 7.1 is reading the data from the file correctly. I put in, using  
> O D S WW,GATE,WIDE,WIDE/APRS V WIDE,WIDE into the DIGIPATH and saved  
> it to CFG71.APR ...

APR REPLY: There is the problem. Read the PROMPT. In 71, there is a new format for the OPS-DIGI command that requires you to include the word VIA. IE enter WW VIA GATE,WIDE....

> I also have noticed that the E outgoing message kill command no  
> longer skips BLNS when ERASING...

APR REPLY: OOPS, ill check that. Also, I tried APRS71 with some of the new DF commands and found enough quirks, that 71a is right around the corner...

> Connected packets... are FAR less lengthy than these long, long beacons.

APR REPLY: NOT if you use the same LONG-LONG path, hi hi Also each user should look at his own beacon and see if it includes useless information. Such as callsign, city and state. The posit shows u to the nearest 100 yds, why waste air time telling everyone what city it is in. hi hi We are seeing a lot of QRM on our VHF network from HF activity coming in via HF gates, that we are now discouraging anything beyond GATE,WIDE. Here on the East coast, with 5 full pages of VHF'ers, 60% of our traffic is seen from a few HFers on HF.. Now that the HF net is alive and well, HF users need to remember that every single packet they transmit is being duplicated many dozens of times in VHF networks all across the country. The HF'ers don't see any feedback that EVERYONE in the country is seeing them because VHF does not feedback to HF (thank goodness, hi hi)

This is not an attack on the individual submitting these observations, but it reminded me of some things I have meant to pontificate about anyway, hi hi. Thanks Larry!

## 91. Track station ID packets

From: jeff.brenton@espi.com  
Date: Sun, 09 Jul 95 17:44:15 -0500  
To: aprssig@tapr.org  
Message-ID: <9507091744.00X2705@espi.com>  
Rendered body type: text/plain

A suggestion for an APRS feature - track ID packets received from stations, so it is easier to figure out who's a WIDE, a RELAY, or whatever. I like to explicitly specify the first couple of hops from my QTH outbound, so knowing what IDs are set up as WIDEs (and especially knowing which ones are GATEs) would be nice. If this were included in the DIGI page (doesn't need to be a special one), I'd be very happy....

Another suggestion for those running GATEs - please specify what frequency or frequencies you gate to/from. I \*think\* the GATE in our county is to/from 10.151, but have no way of knowing, other than setting up a monitor on 10.151 and seeing whether or not the packets there appear on 145.79!

## 92. HF GATE PROBLEM

From: wnolle@ro.com (William Nolle)  
Date: Sun, 09 Jul 1995 19:11:02  
To: aprssig@tapr.org  
Message-ID: <199507100017.TAA23617@sh1.ro.com>  
Rendered body type: text/plain

I wanted to tell the HF users that the path's they use that i see are always like GATE,WIDE,WIDE,GATE at minimum. And to Larry i don't know if you are what you said you are Hi. But it's not that simple. I want everyone to understand it's NOT that they show on the map, BUT THE TRAFFIC (MESSAGES) they create. And FOR WHAT PURPOSE? i'm not being sarcastic i would really like

to know why they beacon onto VHF when they can communicate much better by just using HF. I could care less at that point where the guy lives or his location specially when i'm trying to use it for DF'ing or we have heavy weather in the area (They don't know or maybe even care) about that.

If it worked like Bob intended it to be used would be another story, since it was designed for Boats and Mobiles with GPS so the person at home could keep track of them. Well i haven't seen it used in that capacity in the last several month's not in this neck of the woods anyway!. I have received 5 messages so far and all are in favor of what i'm asking for. I still would like to see a version for VHF only then if i don't want those HF users to interfere with our use of APRS then i could just run that version. Why are we forced to listen to all that HF traffic, personally i think the HF gate's are killing APRS on VHF!. Again fellows throw me all the flams you have but please don't do it here on the SIG. my address is below even if you are for HF Gate's, I'm going to save some of the path's just to show that the rules for HF do not apply here.

Again i'm for a version without HF Gates so we can carry on our local functions without their help Hi. If not we already have talked about way's to do it, but it may not be to the liking of HF Gate users.

AND PLEASE, PLEASE TELL ME WITH PRIVATE E-MAIL WHY IF YOU USE THE HF GATE TO VHF WHAT THE PURPOSE IS IF NOT RUNNING GPS, I WOULD REALLY LIKE TO KNOW. Thank you for listening Hi Hi...

Bill (KE4EER)  
wnolle@ro.com PS: Bob the change wouldn't work!....

>Larry KN4IM

I can understand Bill's issue with the GATES. [They are interesting when showing off APRS and to help "spread the virus". But they do add lots of extra clutter, especially when the path being used is W,W,G,G,W,W.

I also see one other side of the coin: Interestingly enough, I found myself in Boone North Carolina the Friday evening before July fourth. This is a small town that offers little besides tourist traps, a beautiful mountain setting and ski slopes in the winter.

My friend, N4ZJY lives at 4300 '. I wanted to see if he would get the virus going in his area, so I planned to leave him a copy of APRS and see what happened. We fired up and lo and behold: We saw WA4SSP about 40 miles away. Then we saw a digi in Hickory (sound familiar, Larry?) Then we saw Larry's station in Charleston, SC.

Just for grins We tried wide,wide,gate,gate,wide. A few seconds later, a local station from back home in Atlanta messaged me. He was as surprised as I was that I popped up on the VHF net back home. I was able to update my

position and the wife saw it on her PC. Nice, since I was on a two week road trip.

I used the GATE for its intended purpose: to get my MOBILE position report back to the local net. However that is not one of the "approved" uses in Bobs's new very annoying message that pops up in version 71. I'm glad I was using v 70 that day!

I just thought I would reply, since Larry's gate and the stations in Hickory, NC seemed so familiar to me.

Also- all this weekend, I used the Gateway filter BOB added in 70 (I think). It worked out well. The traffic still cluttered the freq a bit, but it did not clutter my map.

Let's keep the GATES, they serve a very useful purpose. Especially for a VHF mobile traveller like me. But let's EDUCATE the users a bit more!

---

THAT part I understand (some other folks, apparently, didn't)

> And FOR WHAT PURPOSE? i'm not being sarcastic i would really like

They DON'T "beacon onto VHF". Someone else (beyond their control) does it for them. (your LOCAL GATE station)

> I still would like to see a version  
> for VHF only then if i don't want those HF users to interfere with our use  
> of APRS then i could just run that version.

Well, one way that comes to mind is to run APRS on some other frequency than the one that the GATE is running. You wouldn't see ANY HF beacons at all! If enough folks in your area feel the same as you, and you can find a clear freq, that would solve your problem.

Here in the Boston area, we have just had a GATE open up for business recently (our FIRST) and I understand what you are saying about the amount of traffic it makes on the network. At present I don't have any problem with it, but I understand where some folks might.

>  
>  
Bill, Larry here...it's really me. Why not just change the alias of  
your MYG locally to something else, something we can all agree on as a  
standard so if someone needs to use it, they can. We used to use airport  
designators (mine is CHS) for packet nodes, we could set MYG CHS when we  
didn't want to see the HF traffic. I have read all the messages and will  
now use NONE for a path when chatting with an HF STATION. Of course, if  
I'm chatting with Bob, or any other VHF station, I'll have to use  
GATE,WIDE (or the airport designator above) to get to him. The simplest  
solution is to change the local HF gateway to something else. That will  
stop the GATE,WIDE digis from coming across.  
73, Larry KN4IM  
PS-My phone goes crazy if I turn off the HF for 20 mins while on inet!  
They all miss watching all the HF traffic across eastern SC from my  
400W 330' WIDE....it's different here.

>  
OH OH...HERE WE GO! I'm glad you saw our WIDE,WIDE beacons from the  
Hickory machine. My WIDE runs 400W at 330' in Moncks Corner, about 20 mi  
N of Charleston. It has amazing service to the Hickory machine. Stations  
in Alabama and St Pete, FL also report seeing my WIDE when the band is  
open, which is often here. You are welcome thru my WIDE/GATE as are all  
APRSers anytime. Glad to be of service.

I still see the simplest solution to the GATE,WIDE problem is to change  
MYG to some STANDARDIZED alternative.

I had another idea for Bob. Maybe we could get APRS to precede message  
traffic with another path, a message path separate from the data path,  
then reset the path back to normal for all other reports, like positions.  
The stream to the tnc is NEVER crowded, not at 4800 baud up. The tnc  
will take a UNPROTO command very fast, I've tried it. You can't see  
it if it is done at 4800 baud. Let's say normal is GATE,WIDE/APRS V WIDE  
and the message path needs to be KU0G-1/APRS V WIDE (OH? you mean I  
could also use this to digi into uncovered HF areas??!) APRS sends tnc:

U APRS V KU0G-1/APRS V WIDE  
:WB4APR :Bob, I'm trying a new message path to you!  
U APRS V GATE,WIDE/APRS V WIDE

With the reset path the next position beacon would hit the GATEs. The  
message output would not disturb anyone thru a gate, no messages would  
show on remote VHF ANYWHERE! Is this a possible idea to solve this  
problem??...Larry KN4IM

## 98. Garmin-75 lockups

From: JeffS5@aol.com  
Date: Mon, 10 Jul 1995 01:42:39 -0400  
To: aprssig@tapr.org  
Message-ID: <950710014145\_111415043@aol.com>  
Rendered body type: text/plain

While playing with my -75 (v.2.32) the other day, it all of a sudden quit  
working; display on, but no keyboard action or screen updating. The only  
rescue was to pull power. This continued to happen so I called the Garmin 911  
man and splained what was going on.

His 1st question was how I had the I/O configured, which I said it's  
supplying APRS data. Next question was which datum was running. I told him  
CONUS 27 (was playing w/ old Marine Maps), "why, is there a problem with  
different DATUMS?

-pause-

The engineer said that they had noticed periodic lockups with various other  
Datums than WGS-84 when the I/O was enabled but didn't know which one's they  
were.

FYI . . . If your GPS-75 starts getting stupid, check &/or change the Datum  
before sending it back.

## 99. RUNNING APRS in background

From: jeff.brenton@espi.com  
Date: Mon, 10 Jul 95 01:40:03 -0500  
To: aprssig@tapr.org  
Message-ID: <9507100140.02CC40A@espi.com>  
Rendered body type: text/plain

Barbara KK6IB asks if APRS can be run in a window. Unfortunately, that is 100% dependent upon your video settings. I've found that it is incompatible with both Windows and OS/2 in 800x600 and 256 colors; the video mode used by APRS won't run when it is not in the foreground.

Some people have reported that it works fine when you limit your Windows to 640x480 and 16 colors, but that means you can't run a lot of other programs, especially if you want multimedia.

I'm thinking about putting one of the '286 computers we're retiring from one of our customers together as an APRS "background" machine...

Gee, Jeff, sounds like we're due a FREE EPROM BUG FIX. Fat Chance with  
Garmin, I'm sure. You have the first report I have ever heard of them  
admitting, even after the pause, that they had a software problem. Keep  
after them, keep calling and hounding. It may help all Garmin owners  
get their rigs fixed. My Garmin locks up when it gets hot, say above  
95F. This should also not occur, but turn the A/C on and restart the  
unit and it cures the problem.

> A suggestion for an APRS feature - track ID packets received from stations, so  
> it is easier to figure out who's a WIDE, a RELAY, or whatever.

APR REPLY: Knowing how a packet got to you via a GENERIC digipeat is  
nearly impossible, but your comments should be well taken. EVERYONE THAT  
IS OPERATING A TNC with any OTHER ALIAS than RELAY should put that in their  
POSIT!!!! Now that we are converting over to WIDE/RELAY backbones, sysops  
MUST include the words WIDE/RELAY in their POSIT comments. I am going to  
change the color GREEN to match only WIDE/RELAY digipeaters, since they  
are the correct APRS tracking network implementation. WIDE only's are  
no longer of value to mobiles...

> Another suggestion for those running GATES - please specify what frequency or

Did anyone else notice the positions and DOPs going nuts over the last couple of days? I was seeing error estimates of over a mile on my Garmin 55 AVD Saturday. And before that, on Thursday, I had real problems getting good positions.

I am wondering if the system got diddled last week, or if I just happened to live in the "poor coverage" area this time?

### 103. Re: [APRSSIG:2116] HF GATE PROBLEM

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Mon, 10 Jul 1995 10:32:06 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950710101608.29078F-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

Concerning the problem that the Alabama station is having with seeing HF traffic on his VHF network, You will notice that I have somewhat agreed with him and suggested some HF path changes to minimize the problem. But since it seems that some people still don't seem to understand how GATES work, I offer the following:

APRS software has nothing to do with GATES or how HF stuff is getting into your VHF net. There is only ONE source of all that HF traffic on your VHF gate. There is someone in your local area that has his KAM TNC hooked up to both HF and VHF at the same time and he has his TNC GATE callsign set to GATE.

EVERY HF packet you are seeing on VHF is being sent to YOU by this one and only KAM in your local VHF net. That KAM will gateway no matter what APRS is doing and no matter whether the owners computer is even running or not. GATE is purely a KAM TNC function.

I agree with your concerns somewhat and have suggested that HF users back off to using an UNPROTO path of only GATE,WIDE. This will assure that your VHF station will only see HF packets gatewayed by a GATE station within range of your own local WIDE. This should make it easy for you to identify the GATE operator and to negotiate terms and conditions for your local net with him. HE and only HE has the ability to control what HF stations you see.

Hope this helps...

> Bobs's new very annoying message that pops up in version 71.

APR REPLY: My VHF "BITCH" warning is just that. A WARNING! It makes sure you know what you are doing. It does NOT say "DONT DO THIS"

I use WIDE,GATE,GATE,WIDE when I need to talk to someone, but the "BITCH"

warning helps me remember to not leave it stuck in that mode.

So I am not just looking at the D-LIST looking for "violators", But when I do see the same stations day-in and day-out always using W,W,G,G,W,W, then I am glad the bitch flag is in there hi hi. So do NOT start POLICING stations that use imaginative paths for fun occasionally. Similarly ignore the "bitch" warning as long as you are doing something that is temporary or causing minimum QRM to others. Listening to the BEEPS and seeing your screen botched up every time you transmit is a small price to pay for being able to contact a friend half way across the country via APRS, hi hi.

Thanks RWF, for giving me the opportunity to clarify this point.

I Like LARRY's suggestion to use the Airport designator as the alternate generic name for an HF gateways GATE call. Although most areas will probably want to remain as GATE, at least this gives a standardized alternative. Who knows, maybe someone can convince Kantronics, AEA and PACCOMM to offer TWO MYGate calls in their DUAL PORT TNCs! Then the gateways can be used to GATE normal traffic but can also be addressed INDIVIDUALLY. Any one know how to forward this message to KANTRONICS? I know that some AEA people and PACCOMM are on this SIG already.

Hey larry, read the NEWNOTES.txt file included in every APRS upgrade. You will notice that the alternate DIGI paths for MESSAGES is the whole reason for APRS71 and for the new format of the O-D command that you had so many problems with. hi hi

It has problems, but it does let you alternately route messages from your standard BEACONS path.. I posted a long message here on the SIG that described the problems inherent in using this technique. I will see if I kept a copy and send it to you...

Goody, a topic I know something about for sure !!!

I have used three different GPS units in Helo's with NO problems... one was the built in Rockwell system which uses a patch antenna located about 1/3 out the disk from the hub... no problemo... (it's an HH-60G Pave Hawk)... I've also used a Garmin 45 on a Pave Hawk just holding it out the window... however the aircraft was on the ground (with blades turning) - the Garmin 45 can't operate (I've been told - though unverified by me) when you are moving above about 100mph... the final unit I've used on helo's is a Trimble Flightmate Pro...(which doesn't have the velocity restriction of the Garmin) on both the Pave Hawk and a UH-1N (Huey)... The Pave Hawk use was out the gunners window and the Huey was with the stickup antenna up in the greenhouse above the Pilot... No problem... any questions?

Al AH6LS

-----

And, for those who were wondering, I hear time and again of the rotor-blade phenomenon. GPS mounted on a helicopter should not be beneath the rotor blades. As far as THAT signal is concerned, you might as well be rotating a solid metal disk over the antenna. Someone at Texas Instruments asked me about this a couple of weeks ago: and he was the senior GPS integrator on that project...

## 109. Excessive quoting

From: jeff.brenton@espi.com  
Date: Mon, 10 Jul 95 11:24:22 -0500  
To: APRSSIG@TAPR.ORG  
Message-ID: <9507101124.0G0UN04@espi.com>  
Rendered body type: text/plain

PLEASE, folks, if you insist on quoting entire messages, PUT THE QUOTE AT THE BOTTOM!!!!!!

In the last two days, there have been about a dozen messages which had NO NEW CONTENT until you scrolled for one or two screens. I've read the previous message - usually in the same pass - so I don't need it parroted. It is far better to paraphrase the points you're responding to, because it shows how you understood the previous message, which may not be the way it was intended - I've seen discussions that went on for days between people who weren't talking about the same thing, but thought they were!

If you must quote literally, do it with as few lines as possible to indicate what you're replying about.

Rendered body type: text/plain

Gary Creager asks if there has been screwy coverage in the past week on GPS; where you live you shouldn't have been affected by this, but... There have been Notices to Airman out since April for tests of jamming-resistance of GPS in the area of Albuquerque, NM, and "within 400 nautical miles" when airborne. The length of the tests was only supposed to be a month, then it was two months, now it's ???

I think you'll find that the ability of a GPS to receive whilst on a helicopter is very dependant upon the algorithms used in

the receiver. Most blades are made of composite materials and therefore represent no attenuation path to the signals (or very little).  
ARNAV do make avionic processors which have a special helicopter model, so they must need some changes to account for helicopter use.....

## 112. Round the Lakes with APRS/GPS

From: jra@ag9v.ampr.org  
Date: Mon, 10 Jul 1995 10:30:28 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <199507101430.KAA18328@ag9v.ampr.org>  
Rendered body type: text/plain

Just thought I'd report on the trip I just made around Lakes Huron and Superior with my Magellan GPS and APRS laptop running in the backseat.

We covered 2850 miles in 10 1/2 days, and I have a position plot every 5 seconds of the whole thing!!! The system worked really well, though I wasn't running APRS on the air -- most of the trip was out of range of any other station, so I thought it wouldn't be worth it.

The Magellan with its antenna stuck on the roof with a suction cup mount, and a 5 foot piece of RG8X feedline, worked very well. We had solid coverage except for a five mile or so stretch of the Keewenaw Peninsula in Michigan where the tree canopy completely covered the highway. The suction cup stayed put for the entire trip, without having to be reset even once!

5 second position updates work very well to create an incredibly detailed track -- you can see every turn we made. It does create a <lot> of data -- about 140 - 175 kB for each day's ~250 mile drive -- but the filtrhst.bas program lets you trim it down to size for a display of the whole trip. Running filtrhst with a position delta of 10 miles generates a smaller .hst file that can play back the outline of the whole trip pretty quickly.

The volunteer mapmakers have done a great job, but unfortunately we were in some remote areas that aren't mapped with much detail -- particularly along the north shore of Lake Superior in Ontario. One of my projects is going to be creating a "northern lakes" map to use for playing back this trip.

My daughter really liked to look at the screen to see where we were (and how far it was to the next stop), but the color laptop display was hard to see in bright sunlight. Of course, we didn't have too much sunlight to worry about on this trip. :-(

If anyone's interested in a big (1.8MB or so) .hst file for testing, or to use in improving maps of Ontario, Minnesota, Wisconsin, or Michigan, I'd be happy to zip up and mail some or all of it. You gotta promise not to send the speed info to the various police departments, though!

## 113. Garmin GPS-21 DGPS

From: lbailey@hti.net (<Lance Bailey>)  
Date: Mon, 10 Jul 1995 12:55:22 -0500  
To: aprssig@tapr.org  
Message-ID: <199507101801.NAA00787@wally.hti.net>  
Rendered body type: text/plain

Does anyone know of any "Problems" (Design or otherwise) with the Garmin GPS-21 DGPS unit? A local Boat and Marine supplier warned my boss away from buying one, saying "the last three customer's who bought GPS-21's are having serious problems". Also, a co-worker returned his new GPS-21, just a short time ago.

Our location is coastal (49-odd miles from the Galveston beacon), and I had

entertained the idea of doing some "HAM Recon" into the world of DGPS.

Rendered body type: text/plain

Some helicopter blades may be made from composite materials, but their dielectric constant is still different from unity which means they will scatter/diffract EM fields. Since the blades are also moving, the signal components picked up by the GPS antenna will be partially phase modulated. It would seem to me that this could corrupt the signals processed by the receiver in some cases.

Hello I am the autor of XMIT\_ID.

This is the program that uses a sound card to get finger prints of radio. This program is getting to a point where I believe it can be come a very good part in finding repeater problems. What I would like to propose to the auther on APRS. It use my program in fox hutting part of the program. Here is how a radio comes on the air that is a known fox. I will ask all station for a signed to noise ratio. With a kucuk you could get a good location on him. In fact with so refinement I cound use the PL tone and the dopper shift get a vextor on a moblie fox.

I do know that this will not be easy but I am willing to put the time in.

Rendered body type: text/plain

Sorry to be talking all the time, but Im still excited from my first DOPPLER fox hunt this past weekend and Im working on version 71a. I need to know 2 things:

- 1) I wanna put in a velocity limit below which GPS should NOT be trusted for a good heading. If you are running APRS mobile all the time, watch your heading for a week or so, and send in your opinion. For now I'm going to use 4 kts, but suspect it could go lower, since the GPS unit itself is doing some averaging internally... I know that 2 is about as low as I wanna go, cuz I see those kinds of errors due to SA.
- 2) Im using a modified copy of about version 68 or so on the Naval Academy Sail boats in SPM mode. We see posits all the time, but NEVER have seen a course and speed. I thought I had all that stuff fixed??? Is everyone else seeing CSE/SPD in SPM or other modes most of the time?

Rendered body type: text/plain

4 is a good number, Bob. My GPS-50 will falsely display up to about 3 when sitting still, probably from multipath reception overhead from local objects as the sats move past us. I think a lot of stations see this false movement. Try this...Go out in a very clear area, such as an open field with no overhead power lines. Watch the still speed, mine reads 0 or .1-.2 constantly. Then go back into the city where there are lots of obstructions, wires, buildings, billboards, other reflective or refractive things. Mine will always read the phase wrong bouncing off these objects. Sometimes a satellite's signal will arrive late because the gps can't really see the bird, only it's reflection off something else. This reflection constantly shifts because of the bird's movement, causing many errors. Check it out... 4 or 5 is a good number. None of us drive that slow, and even if we did the near-fix filter would have gotten us anyways.

Rendered body type: text/plain

The July issue of GPS World has a 4 page article (starting on page 54) that "explains" the NMEA 0183 standard/output.

The good new is that APRS made the article. (O.K. so it was one paragraph, an full color picture {only picture in the article, and with a primitive map no less, hi..hi..} and a footnote for Further Reading.)

The mag just came in at work and I only scanned the article, but it looks interesting (for some reason, my eyes zoomed in on the APRS stuff off the bat.)

Rendered body type: text/plain

I have had a few problems with the GPS-55AVD under turning blades, but since I did it as a quick test, it cannot be appropriately quantified. I classify this as something to keep in the back of your mind for when you hit the snag and it doesn't work. It's not something I would use to guide me in placement of the antenna unless I had to "absolutely, positively, on time" make sure it worked the first time out... and then I'd use every trick I knew.

Effective today, I will no longer beacon myself as GATE,WIDE....I will appear on local VHF and on HF screens only....but any mobile VHF APRS user wishing to beacon his posit to his home "port" is welcome to use WIDE,GATE,GATE,WIDE to do so....unfortunately, said user will have to know there is a receiving station at the other end if that station is also not beaconing HF->VHF.

in fact, some of the composite blades appear as a disk and may represent more of a barrier while moving than while stationary, depending on the composition of the inlays. Graphite is conductive and when spun around the blade for strength, then rotated it can "appear" to have a longer dwell time than a solid metal blade... or so goes the theory. Of course, your mileage may vary, as we've discovered in this thread already.

> ARNAV do make avionic processors which have a special helicopter  
> model, so they must need some changes to account for helicopter  
> use.....

I would consider adding an averaging algorithm for a helicopter, especially if you're receiving PPS code. The instantaneous movements of a helicopter can be of a higher dynamic than an airplane. That could make you see some induced error if you follow one manufacturer's standard practice of predicting the next second's position based on a progression series from the last N positions and derivatives.

I'd suggest even less... 1-2 kt. I've gotten good heading info doing a slow walk across a roof to aim a repeater link antenna, and my walking speed is guaranteed to have been <2 kt.

> 2) Im using a modified copy of about version 68 or so on the Naval

I'm getting good course/speed using GGA sentences. I noticed today I can really confuse APRS with GSA and ZDA sentences, something I require for another program I have been working on.

When running APRS in the car, I only enable GGA and go on.

## 128. GPS-45 Velocity

From: W2H0B@aol.com  
Date: Mon, 10 Jul 1995 21:32:08 -0400  
To: aprssig@tapr.org  
Message-ID: <950710213201\_112023479@aol.com>  
Rendered body type: text/plain

Hi Bob... this is for you and the others interested in the GPS-45 and  
velocity...

I have a Buick Regal with a digital speedometer/odometer. I took the GPS-45

out for a spin to see  
how accurately they compared with each other. They give up super closely...  
if the speedometer  
says 65 I look over and the GPS-45 says 65.4 or at least further defines the  
speedometer.

So, at least if one's off, they're BOTH off cause they are almost the same  
within a few tenths.  
I define "few" as 2,3 or maybe 4 at the most!

The velocity thing you're interested in... I haven't seen a problem with slow  
speeds with the GPS-45.  
When I'm stopped, it says 0.0 mph. No glitching to 0.1 or anything. Sure, it  
tracks slower than the  
speedometer cause it's got to receive and calculate, receive and calculate,  
etc.

This wasn't a lab-conditioned experiment, just an experiment that lasted over  
several days to see  
what would happen. I don't know that you would need any minimum threshold...  
the thing even  
tells me how fast I'm walking!

Good luck. This is a ball. 73 de Boyd

Rendered body type: text/plain

After reading all the docs (red face) I have concluded AltNET is the  
way to go when we wanna BS on HF and not bother anyone, including the  
other guys on HF. BUT...I got a big problem....

When I ALT-S M N and turn AltNET on, the only thing that happens is  
the prompt comes up under the upper right hand window of amazingly  
useful data telling me AltNET is active. NOTHING GETS SENT TO THE  
KAM TO CHANGE THE U COMMAND! ARRRGH! In order to get AltNET to  
work, I finally figured out I had to re-initialize the KAM with  
C B H to force the new UNPROTO command to the KAM. ARRRGH! AND...  
AltNET can't be initialized AT ALL on the VHF port as it has no  
effect on the /APRS V WIDE part of the UNPROTO statement which controls  
the KAM's VHF UNPROTO command. Bob? Bob? Hmm..I guess he's gone after  
his shotgun and headed for South Carolina...guess I better hide..

GEE, if we keep on turning off every packet to satisfy a few who can't find their GATE (how they do that I can't imagine), or are in a turf war to hold "my VHF frequency at any cost", then nothing will come across my screens to VHF. My VHF users, mostly techs or generals who don't have HF packet, will all get bored looking at blank maps. They will soon find something better to do with their equipment than that 'DEAD APRS SYSTEM' and I guess there won't be any reason to monitor 10.151 (AGAIN) as it will not have any packets on...everyone being afraid of antagonizing this one bitching or that one bitching...who can't find his GATE (how they do that I can't imagine)....

There is only one thing I have against that.....

I now have about 10 (a guess) stations here that sent Bob \$24, like good boys, so they would have a fully functional APRS system to use so they could monitor and see all the neat stuff, like the bike races in GA that were beacons via GATE,WIDE (THANK GOD) SO EVERYONE, NOT JUST A FEW WHO THINK THEY CONTROL EVERYTHING, would see it. Now I know, to some, that \$24 is nothing, a pittance..it is for me...BUT now ole' Larry will be an SOB in the local packet community because he got all the guys to do the right thing and send in the bux. Bob deserves EVERY BUCK HE GETS! Now some jerk, whoever, comes along bitching that all these bike (or any other GATE,WIDE) beacons are "jamming up my local WIDE". He demands we all turn off everything. I just read KD4URY'S message that he is buckling under and turning it all off. What my VHF users, the paying kind, are seeing is ALREADY lots less...KD4URY'S great wx beacons from Tampa/St Pete will no longer show up on WIDE in Charleston. Noone here but me will have his auto wx broadcast.

I hope you are all, the bitches, happy. I know about 10 paid and 15 still unpaid users here that are not. I guess the 15 will breathe a collective sigh of relief at not being ripped off by Larry KN4IM from his begging them to send Bob the registration...just to watch the blank screen with just locals on it.

Thanks...Larry KN4IM

PS - I'm glad my users can't read this aprssig...

Bob- I don't think I have \*ever\* seen course and speed in the P list. I thought it was just something peculiar to my installation. I run GPS/TNC in SPM 24 hrs a day in my van. It sure would be nice to have it work. But I wonder one thing. If you get it working, will the Ga State Patrol get APRS and send my speeding ticket to my Callbook address?

Rendered body type: text/plain

Many comments in the past few posts on the topic of GPS in helicopters look rather speculative to me. Having installed several GPSs over the years in fixed-wing aircraft and helicopters I can report that there is seldom any difficulty from rotor blades, dynamics, etc, etc. More often you will find other things getting into the GPS signal, such as hash from the igniters (if used), strobe light power supplies, etc.

Graphite composite rotor blades are generally not conductive, as the fiber is embedded in a plastic resin. Therefore most have metal strips added to aid in draining off the static charge that would otherwise accumulate.

Rotor modulation of an analog navigation signal such as VOR can be a problem and for this reason, VOR/LOC antennas are usually located on the tailboom or under the cabin. However I have never seen a problem with rotor modulation of PR code signals such as GPS.

Helicopters indeed may be flown with different dynamics than fixed-wing planes or cars, but not \_that\_ different. We saw no difference in using Trimble TNL1000's for instance in cars, planes and helicopters.

> I would consider adding an averaging algorithm for a helicopter, especially if  
> you're receiving PPS code. The instantaneous movements of a helicopter can be

...not too likely you'll find a PPS (Precision Positioning Service, the encrypted military version) outputting NMEA, or used for APRS! We can always dream, though...

Overall I was very impressed at how robust the GPS signal was. Not to worry about putting them in any type of aircraft.

> components picked up by the GPS antenna will be partially phase modulated.

Indeed -- but the signal will also be phase modulated by all sorts of  
other things, and being a pseudo-random digital code, it is either  
recovered correctly or not at all.

> It would seem to me that this could corrupt the signals processed by the  
> receiver in some cases.

Yes, it would seem so, but if you examine the channel coding algorithms  
you will see that they are very resistant to such modulation producing  
anything other than a slight degradation of signal to noise and thus  
DOPs.

OK.  
As far as I understand things there is a difference between the

way in which most GPS receivers calculate velocity (i.e. SOG & COG).  
 I think that the lat. & long. is calculated the same no matter  
 what sentence is used.  
 However, I was lead to believe that the data in RMC regarding velocity  
 is derived from point-to-point calculations, whereas the velocity  
 in VTG is from Doppler measurements. Is this true? Is this true for  
 all receivers?  
 It appears to be true for Trimble receivers and the GPS-45.

Anybody got any observations?

I went back and looked at the dates of the articles I have regarding this. It  
 looks like they're pretty old, and I suspect it was based on older decoding  
 technology, where sync and timing were of more importance than actually  
 decoding the satellite messages. I'm going to suspend concern for a while. I  
 do feel strongly, based on other experience, that the composite blades can  
 contribute to multipath, but this problem is reduced somewhat in installations  
 where good groundplane practices aid in signal enhancement.

> Helicopters indeed may be flown with different dynamics than fixed-wing  
 > planes or cars, but not \_that\_ different. We saw no difference in using  
 > Trimble TNL1000's for instance in cars, planes and helicopters.

The TNL1000 is high on my list for well designed hardware. I based on what I  
 know of Trimble's averaging circuitry, however, I am certain that they do some  
 short-term position averaging to compensate for high dynamics settings. In  
 fact, I'm fighting this problem now in a fixed wing aerial photography  
 setting... We see 300 meter errors on a regular basis and are looking for  
 ways to get past it with time hacks and tape marks. Suggestions, anyone?

> ..not too likely you'll find a PPS (Precision Positioning Service, the  
 > encrypted military version) outputting NMEA, or used for APRS! We can  
 > always dream, though...

Take a look at the Trimble TNL4000SSi with nav option. It's a "survey"  
 instrument, but does indeed have PPS capability and outputs NMEA strings if  
 you ask nicely!

It's also outside of the budget of most of the folks \*I\* know :-)

> Overall I was very impressed at how robust the GPS signal was. Not to  
 > worry about putting them in any type of aircraft.

When you consider the minimum signal level present by spec on the earth's  
 surface, and a 29 dB margin between that and the worst real core receiver I've  
 looked at specs for (but not yet tested) it's pretty obvious that there's  
 plenty of signal to process. The real questions for aircraft installation  
 that I've seen remain: multipath from various structures on the aircraft;  
 interference from nav and comm gear (Garmin now recommends in one of their  
 publications not using certain comm frequencies, and teh FAA had recognized  
 some interference problems with AM radios), and the vaguaries of antenna  
 connections in the aviation environment, although those made by hams seem to  
 be lasting longer in the cohort of ham-pilots I know.

The recent inaccurate GPS readings made me think of some work I did with the military last year and have not seen mentioned here or on the USENET group. While working with the AN/PLGR (I believe this is the correct designation of the military GPS unit manufactured by Rockwell) my test program was severely limited by restricted access to the piece of equipment. This was due to the fact that the gear was considered crypto equipment. The military has the capability to not only degrade the GPS signal but also disrupt DGPS. This unit has an "anti-spoofing" (their term) capability, that is it is extremely accurate when both the GPS and DGPS signals are scrambled.

My guess is that that anti-spoofing exercises were being performed while your units were recently receiving degraded signals.

Respectfully,  
Jay

Rendered body type: text/plain

On Mon, 10 Jul 1995, Larry Butler wrote:

> GEE, if we keep on turning off packets to satisfy a few...

APR REPLY: Maybe I confused things.. I am perfectly happy with HF stations using the path of GATE,WIDE. I was only asking that we limit it to that and not use GATE,WIDE,WIDE. By limiting it to GATE,WIDE, then it provides a mechanism within the radius of EACH wide for local VHF'ers to have local control over their network. Since I only have VHF at home, I too am dependent on HF users to use GATE,WIDE so I can see "some activity" hi hi...

## 145. APRS in SPACE THIS WEEK!

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Tue, 11 Jul 1995 12:36:57 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950711121322.4174B-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

In follow up to last weeks message, APRS has been approved for limited testing during SAREX on the STS-70 mission scheduled for launch on Thursday (13 July). To get a good test, under controlled conditions, this information is being limited to subscribers to the aprssig only, where the number of uplink stations is known and there is a mechanism for real-time feedback.

The primary objective is maximum number of ground station POSITS on the map. (the shuttle will not be beaconing its position)

To achieve this objective:

- 1) Keep packets as short as possible. Use APRS GridSquare mode or SPACE mode if it is in your very recent version
- 2) Put minimum IF ANY text in your alt-BEACON. First name, or school would be fine. DO NOT put your call, city, state, SAREX, CQ or any other REDUNDANT information in it.
- 3) In GridSquare (and SPACE) mode, both your BEACON and POSIT are identical. Try it on the ground with your local digi to understand what your packets will look like.
- 4) Remember to set your unproto path to W5RRR (Gerry, can you confirm this?) Im not sure which call will digipeat
- 5) If your station is un-attended then your once every 20 minutes beacon/pos are certainly not going to hurt anyone! But if you are there, then hit X-P command to send out your POSIT (maximum rate is about 1 per every 8 seconds...)
- 6) Be sure your CONTROLS boxes show you in OTHER mode, so that you will see any NON APRS packets too.

PRACTICE WITH THE GRIDSQUARE MODE AND YOUR LOCAL DIGI. EVEN I CANT REMEMBER ALL OF THE INTERNAL TIMING. I will look it up and post it here in the next day or so.

DO NOT have exceedingly high expectations. Remember that SAREX will most likely be in "SCHOOL" mode over the US for voice contacts and we may see very little packet mode. But if the packet is turned on, APRS IS AUTHORIZED TO TRY TO DIGIPEAT THROUGH IT.

Title : INDIANA BALLOON LAUNCH 7/15  
From: KA9SZX@N9LNQ.#ECIL.IL.USA.NOAM

On July 15 at 7:30 CDT (weather permitting) there will be a helium balloon launch from Veedersburg, Indiana (20 miles east of Danville, IL) to test the deployment of 3 helium balloons to lift a package aloft with minimal spinning. The package will contain a Amateur Television transmitter on 439.250 running horizontal polarity on the antenna and providing two camera views plus a video Id'er with the call KT9V. A GPS receiver and packet telemetry software running at 1200 baud giving position and other balloon status on 446.000 with the call of WB9IHS. Also on board will be a cross band repeater. Input will be on 144.300 FM with outputs on 444.850 and 52.525 with the call on the repeater of W9DUU. A HF net on 3.871 will be hosted by Emmett, K9YKX to provide status of preparation, launch and status of the balloon during the flight. This balloon is expected to reach an altitude of near 100,000 feet and should have near 400 mile range from the balloon at peak altitude. All Amateur operators are encouraged to participate in this flight.

Ok, myself and Tom, WA0WSW, have been playing with his KAM.  
I have been reading alot of notes about the "PROPER" way to configure your station. Without sounding like a DINGUS, whats the deal guys..?  
I am confused as ever.

Of course I dont want to be a lid, but what do we do to acomplish the following..

#1 I would like to see the local VHF stations driving around...IS that not ok to transmit that data, does it QRM ?

#2  
How do I allow my VHF users to see everything on HF ?

#3 Do I set it up as Gate, wide/ Wide Wide..?

I am confused....

Isnt the idea to see the neat local stuff happening..? OR does this QRM everyone ?

IF there is a special event, should I change the configuration to Gate, WIDE, WIDE/WIDE,WIDE..?

Thanks in advance for the help.  
Mike KD4EMI

Message-ID: <199507111949.PAA21898@sumter.awod.com>  
Rendered body type: text/plain

Mike, set the MYG of the HF station to GATE. That will crosslink all the HF stuff to your local VHF system (on 145.79 we hope). Set the HF station's APRS program to GATE,WIDE/APRS V WIDE,WIDE (the 2nd WIDE is optional for your area, we use it here to repeat in NC's Hickory station.) The local VHF stations should all be set to just WIDE or WIDE,WIDE to hold down on the HF system loading. They can TEMPORARILY set their path

to WIDE,GATE,GATE,WIDE to let the world know who they are or if they are involved in a special event to let us all see it out here in Radioland. NORMALLY VHF STATIONS SHOULD BE JUST VIA WIDE, however.

BY ALL MEANS, if you have a mobile cruising around town with a live GPS running either in GPS mode of a tnc or through a mobile notebook APRS, SET IT TO WIDE,GATE,GATE,WIDE so the rest of the world can log your mobile and play with our mapping programs making new tracks! Don't pay any attention to the ones complaining about QRM, the MAJORITY of APRS stations just LOVE TO TRACK YOUR MOBILE, that's what we're on here for! Be careful, however, if you use RMC reporting to keep your speed legal. I'm told your cops now have downloaded APRS and have a log open to watch ur speed! I think they're devising a new "AUTOMATED TICKETING PROGRAM". Wouldn't want you to get a ticket!...73, Larry KN4IM

>this is a basic program that I adapted to work...  
>I call it GAR45HST.BAS

I have returned and can now answer the statement I made, I used GARMAN a window's program to download the track info from the Garman 45. The Garman store's the last 761 posit's internally.

I FTP'd the Garman.zip file from sundae.triumf.ca \pub\peter directory lots of good Garman and GPS files here.

1. Place your Garman 45 in GARMAN/GARMAN host mode track output.
2. Garman 45 out cable should be brown data out to pin 2 (9pin rs232), white data in to pin 3 (9pin rs232), Ground is pin 5 on rs232.
3. Set up the garman ini file for your correct rs232 port
4. Run Garman in windows, it will find your Garman and give you the version number in the operations box.
5. Select Download Track, your Garman should show on the screen that it is downloading the points
6. Exit and leave windows and go the the directory where you have the Garman.exe files. The File called GARMAN.TWP is the track you just downloaded. rename it to something else and place it in your HSTS working directory.
7. Run qbasic program gar45hst.bas follow instructions

(BTW I noticed that the one of the input lines was duplicated in the file that I got in version 7.1 so remove it if you see it)

8. You now have a history file that you can play with APRS or with MAPFIX13 to make maps.

(BTW I also downloaded the GARDOWN6.zip file and could not get it to recognize com2 on my computer's or could not figure out how to make a file of the output. Needs Documentation badly. Would prefer this as it is a non windows program, so that I can use my laptop to download tracks while mobile before I start dropping off the fifo posit's, no mouse in mobile for window's.)

Hope that I remembered everything and that is is of some use to everyone.

> ok to transmit that data, does it QRM ?  
APR REPLY: Everything you do on VHF is fine. WHatever your area wants to do.  
  
> #2 How do I allow my VHF users to see everything on HF ?  
APR REPLY: Set the KAM MYGate to GATE and enable the gateway  
  
> #3 Do I set it up as Gate, wide/ Wide Wide..?  
APR REPLY: You UNPROTO path has nothing to do with packets that come  
through your gateway. You have no control over where they go. Only the  
originator can set the path in his packets.  
  
> IF there is a special event, should I change the configuration to  
> Gate, WIDE, WIDE/WIDE,WIDE..?  
APR REPLY: See #3 above. Your UNPROTO path ONLY determines where YOUR  
packets go, no one elses...  
  
SUMMARY: Normally I think that most HF stations should set GATE,WIDE and  
on VHF set WIDE,WIDE. If you are engaged in a Keyboard QSO then adjust  
these paths to match the person you are talking to, to minimize QRM to  
everyone else.

Thanks for the info Larry, I noticed it also in the panhandle, but being new thought it was normal. Have 5 or 6 stations on in the amarillo area now, and I will soon be mobile when I get my validation number and tnc(Any suggestions on mobile TNC's for Aprs?). Also think I could get all you good people in the Lubbock area to add AMA or WIDE to your Unproto on .01? Have the station at the NWS set up as wide. 73 from Amarillo, Ben W55R.

## 154. MIR

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Tue, 11 Jul 1995 18:54:18 -0400 (EDT)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.950711181846.7063F-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

I just happened to monitor 145.55 today (and ystdy) and noticed that when MIR came over, I saw fewer CONNECT-REJ packets and more UI digipeated frames. Seems like a recent AMSAT bulletin encouraged everyone to quit trying to connect to the MIR BBS so that the cosmonauts could have more BBS memory for messages to/from THEM instead of all the From-BOB-to-JOE ego messages. I guess that some of all that CONNECT energy is now starting to migrate towards UI frames. Now if only we could convince everyone to include his 6 digit GRIDSQUARE in his UI packet and keep it short, instead of BEACONS like:

XXXXX>YYYYYY-8,R0MIR\*:CQ via the MIR space station, Sam in TimBukToo, CA

compared with:

XXXXX>QRZ,R0MIR\*:[FM19sx]Sam

These packets convey the same info, but the GridSquare packet is 55% shorter and permits more than twice as many packets per orbit.

Anyway, when your APRS station is doing nothing else, you might find it interesting to monitor 145.55 and see who is digipeating through MIR. Set CONTROLS-OTHER so you will collect non-APRS stations on your L-list. Preferably set alt-5-MODES to GRIDSQUARE or SPACE mode. Your station will send a grid square packet about once every 20 minutes (almost assuring that you will never hit MIR hi hi). Compare that to 10 packets per minute times 10 minutes (100 packets per pass) for someone trying to connect with MIR...

Today MIR is coming over about 6 times a day between 8 AM and 1800 EDT. Every 90 minutes or so. This window slides forward about 23 minutes per day. SO for the next three weeks, while everyone is at work, or sleeping, switch your APRS station over to monitor the activity on MIR and see what you pick up.

- > very little packet mode. But if the packet is turned on, APRS IS
- > AUTHORIZED TO TRY TO DIGIPEAT THROUGH IT.

If I remember the schedule the schol list isn't too great for this mission, so there should be a fair chunk of time for independent activities. One thing to know, however, is the "backup" pass for a school is virtually always dedicated to general VOICE QSOs if the initial pass for that school was successful. So, if you're monitoring schools, and know the last one was good, I'd recommend being up on packet next pass, but don't be surprised if they come up on voice.

73, gerry

Hi Ben, yes I've seen some of your posits here in Lubbock when VHF opens up. Glad to see more guys interested up there in Amarillo.

Most of us who are GPS mobile are using Kantronics KPC-3s with version 6.0 firmware. I have a KPC-3 and a PacComm T2M2 and like the KPC-3 much better, mostly because of its ability to be controlled remotely. I also have a couple of Motorola OnCore PVT-6 GPS black boxes which work great with the TNC's in standalone or with a laptop.

Message-ID: <9507120004.AA20707@bungee.SSD.intel.com>  
Rendered body type: text/plain

I've seen bulletins requesting we not run automatic packet operations with MIR. Sometimes they use voice on 145.55 and lots of packet stations sending UI frames would be a rude thing to do. But, if your hear the MIR packet

```
*****
      Bert Flower                                N1MXO
      42 Allen St.
      Arlington, Ma. 02174-1610
      617-646-8013
```

etc. No digi response! As if xmit audio lost (even though xmit on)

Going to O-C-T and trying a connect, I had NO trouble getting immediate responses from the same digis and doing normal connects. This eliminates rig, antenna, tnc and basic computer problems..... going back into aprs, nothing - zip!!!!

Now here's the kicker: Quitting the APRS session, going to a dos prompt under windows, running the aprs .exe file, works fine! THEN, exiting the session under dos, quitting the dos prompt, and firing up APRS again with its win icon, all now OK!!

Have gone through this funny little exercise with 7.1 several times, works without fail.

Still have 7.0b and no problems of this kind with it - only with 7.1!

All this with Win 3.11 on a 486/33, 8mb ram, 16550 uarts, etc.etc.....

I don't need any comments about Win vs. OS/2, Mac, or whatever only wonder if anyone has a clue what this is about!!!

> REGARDING APRS-SAREX, What frequency?

ANSWER>                    Standard SAREX 145.55 DOWNLINK, 144.49 packet uplink.  
We will be competing with all the CONNECT REQUESTS from people trying to  
work the SAREX ROBOT MODE. Also notice that this is the same downlink as  
MIR, so your APRS station may pick up some UI frames occasionally via MIR.  
The UPLINK for MIR is simplex, so if you "UI" on 145.55, lots of others  
may see you and have comments, hi hi.

> happens, either positive or negative. I.e., it doesn't go into DX Cluster

APR REPLY: To go to DX cluster mode, hit alt-SETUP-MODES-DX and tune in a DX cluster node. Alt-A can be done in any APRS mode. All it does is put callsign prefixes on the map. Zoom to the whole world and you will see them. There was one version that crashed, cuz the DXCALLS.dat should now be in the APRS\SYSTEM directory and that version was still looking in the APRS directory for it (or vice-versa)

>  
Bob this brings up an interesting problem and question I have.  
My svga 17 inch high dollar monitor here radiates interference  
which is heard on my hf rig freq 10151.0khz. I have tried several  
different software packages to see if I can recreate the problem  
but the APRS screen is the only program which causes it. I have  
tried to change monitor freqs but it made no difference.

Oh yes I have the same problem on a narrow band on a 7 meg freq also.  
This noise which is being generated is a S9 so trying to work APRS on  
the HF freq is impossible unless I turn off my monitor. The rig is  
a TS450S/AT but I also pick it up on my TS940S/AT. I have tried  
relocating my monitor and HF gear, within reason of course with no  
luck.

What I am getting at is there a way to check and see which screen, 9 or  
etc that APRS is operating in and a way to change screens to see if  
that will solve the problem I am having.

I have even gone so far as to have the company I bought the computer  
from send me two other monitors in case I received a defective one and  
that did not work.

At this point suggestions from any one are welcome...thanks in advance

Brad

DE Sam,

I am trying to develop a system for Search & Rescue where I can give the Search Teams one piece of equipment and we will be able to track them for the Command Vehicle. I have been testing the PK-12 using a handheld and either a Garmin 45 or Garmin 75. System is working fine in the configuration but I need to get smaller and lighter.

The idea is to put a OEM GPS board and transmitter into the PK-12 and use a Camcorder belt-pack battery for a power supply. What I am looking for is any suggestions at to GPS board and transmitters. Have been looking at Paccom and may go this route but would like to see what the APRS community might suggest.

Please include Equipment Name, Company, Address / Telephone and price, if known.

I really appreciate any help you might be able to provide.

OK, it's a bucks worth.. not two cents... anyway

I've seen some interesting postings here concerning possible military activities "banging" on GPS signals... I know enough to be dangerous I guess so I'll be dangerous and put in my 2 cents.

As I understand the system, the GPS satellite signal is really two signals - - I've heard the terms L1 & L2 ... Precision (P mode) and Coarse (C mode) ... C, SA, CA modes etc... anyway... seems there are two signals coming down .... and the more precise signal is the "encrypted" signal (requires crypto gear and "key")...

The signal that all the commercial GPS units receive and use is the coarse signal - which is made intentionally inaccurate by "jittering" or corrupting the time/phase of the signal... by intentionally making the time info a little bit bad... the position accuracy is degraded... SA (selective availability I think) turned on is the intentional jittering of the coarse signal I believe (like I said enuff to be dangerous)...

DGPS signals on the other hand (with a notable commercial exception that I am aware of) are ground based beacons that are limited to a specific geographic area. The limitation is due to the fact that the differential correction signal is satellite dependent and different satellites are in view in different places all the time...

There has been alot said/written - - attributed to the military - - concerning the militarys dislike for "others" having high accuracy information... due to the targeting uses of GPS and the more accurate DGPS signal. To my knowledge (a little bit is dangerous remember) there hasn't been a concerted effort to deny the use of GPS to commercial users... I do know (from personal experience) that bad geometry or terrain masking occur more often than I'd like.... gripe gripe gripe

Spoofing and anti-jam are two specific terms with different meaning for the military at least... Both are categorized as intentional disruptions to operations. Spoofing is intentionally false signals.... look/sound like the real thing - but they are

not (so a spoofing transmission would look exactly like a satellite signal but would have incorrect information).... spoofing at L band (the freq that the GPS satellites signals are on) would be very restricted in area of coverage unless the spoofing transmitter was elevated pretty high.. like in an aircraft or another satellite... antispooing is processing to reject intentional transmissions that are false.... the complexity of the GPS signal - combined with the operating frequency make spoofing a low payback (though still viable) approach to disruption. Jamming is a different thing... the intention here is to make the signal to noise go out of wack... so send enuff bad signal and the good signal goes into the noise... by raising the noise floor up high enough above the good signal....(this may sit funny with some folks... the noise floor being just one signal bandwidth wide... but think about it)... Doggone I am dangerous.... anyway, there are efforts underway vis-a-vis DGPS so that the FAA and DoD can work in harmony.... The FAA cancelled the MLS effort (microwave landing system... follow on to ILS stuff) due to the ability of GPS and DGPS together being able to provide the equivalent capability (what... actually save money !!! BTW... it just might be cheaper to the tax payer to give folks inexpensive GPS rcvr in trade for LORAN and shut down the chain ASAP... hmmm bulk acquisition price probably under \$200 per GPS rcvr... for a million bucks that means over 5000 receivers... oh well how much to keep the chains in operation per year???? )... The DoD wasn't too happy about FAA sending out highly accurate position location signals and so there is efforts underway between the DoD and FAA to address the precision location signals the FAA wants to transmit.... this would involve some control arrangement.... after all, we can't have the national aviation transportation landing system turned off in the middle of the nite with storms in half the cities in the country... hmmm remind me that in the future I should only fly under daylight CAVU conditions...

Meanwhile, GLONASS has a full time highly accurate position signal and the Europeans are in the discussion stage for their own GPS system.... both not controlled by DoD... so any bad person would probably have multiple receivers anyway... not to mention that plain ole INS (inertial) systems are getting real real real good for short distance short time spans... REAL good... (LRG laser ring gyro and monolithic accelerometers over a few thousand seconds and with GA gravatational anomoly data over the intended path known a-priori... heck... star trackers aren't that bad themselves.... even in daylight if the right optics are used.... doggone... a little knowledge is dangerous...) easier yet would be just a couple of previously positioned beacon transmitters in the area of the "target"... with a cheap CPU crunching the position of the receiver in reference to the beacons...makes you wonder what the bru-ha-ha is all about....

Enough... but it does make my mind wander about how I could set up a alternate position location system and input the data into APRS....

Al AH6LS (troublemaker)  
sadowskp@usafcrqs.nellis.af.mil  
BTW, none of the above is with the approval of my employer  
or it's customers so done blame anyone but me and my imagination....

Thanks for the info Bob. On the face of it this program should run fine in a window. I have many compiled basic VGA programs that do ok in a window. I think I might bring the problem to a programming newsgroup and see if anyone has any ideas other than using Visual Basic.

On a different subject, I find it difficult to point with any precision using the mouse because of the lack of an acceleration correction. I assume that this is because of using the raw data from the mouse serial port instead of the user's mouse.drv. Would it be possible for you to get the mouse pointing data from any existing mouse management software on the users system?

As for OEM GPS boards, I'd look at the trimble or Motorola boards, although there's nothing wrong with Rockwell, Ashtech, Novatel, or Magellan, save

PacComm has some integrated solutions already available. Paul and Gwyn can speak to costs and availabilities.

drop me e-mail if you need more detailed info.

within the GPS engines, and the pin-outs for a number of the consumer grade receivers, PPS refers to precise One Pulse Per Second strobes.

In the context of P-code, PPS refers to the GPS system's Precise Positioning System. It's actually government economy, sharing acronyms.

Rendered body type: text/plain

This one's for Brad, I caught hell for quoting before. Have you tried moving the antenna of the offending rig? Sometimes just reorienting the HF antenna will cure the monitor problem. We moved one of the new ham's HF dipole a mere 20 ft so the end was on another tree and now he hears NOTHING from the monitor! MOST of you guys live in transparent (RF-wise) houses. The radiation from the monitor can't get to the shielded radio inside the shielded coaxial cable. There are too possibilities. 1) Direct radiation to an antenna placed right near the monitor (or whatever). 2) Radiation going back up to the antenna along the OUTSIDE of the shield...then back down to trash the rig.

Put a shorted coax connector on the HF rig's antenna jack. Hear anything? If you do, watch the S-meter while unplugging cables, especially the one from the tnc's audio. Unplug 'em one at a time looking for the culprit. Don't forget the front panel mike plug, Kenmore's don't even hook mike ground to the metal cases of their mikes. That's why so many Kenmores have RFI on their audio from radiation the other way. If you don't hear the monitor qrm, pull all the plugs from the rig, incl mike cable, and plug the antenna back in. Hear anything? If yes, try grounding the coaxial cable to the base of the tower...where that wonderful ground system we all have is located. I have a 1/2" aluminum plate u-bolted to an 8' ground rod under the shack where the coaxes come in. There are 6 chassis-mount double female SO-239 connectors in it with plenty of aluminum overhang..connectors very close to the ground. This forms a bleeding-off Faraday shield for RF going up the coax from the shack, and for RF from the HF rig trying to sneak back down the 2m antenna to scramble the KAM. I have ABSOLUTELY NO RF NOISE from the 3 computers, monitors, TNC'S, DSS tv computer on ANY HF frequency. The grounding plate solved all these problems.

Just trying to point you in another direction from blaming the source.  
73, Larry KN4IM

Running OS/2 Warp Connect here and after months of running OS/2 2.10 up thru the latest finally had to give up and put on a dedicated 286 clone. APRS video mode is not supported in a window, nor will it run properly even in full screen background. Full screen foreground is fine, but kind of silly for a multi-threaded, multi-tasking operating system.

## 189. N7LUE interface options

From: CMPK59D@prodigy.com (MR ROBERT D SWAIN)  
Date: Wed, 12 Jul 1995 20:00:38 EDT  
To: aprssig@tapr.org, owner-fox-list@netcom.com  
Message-ID: <013.08588508.CMPK59D@prodigy.com>  
Rendered body type: text/plain

-- [ From: Robert D. Swain \* EMC.Ver #2.10P ] --

Expanded recipient data:

cc: Jerry T. Swain \ PRODIGY: (CMPK59A)

This text includes the Data Mute and Alternate Baud rate options.

#### DATA MUTE OPTION

This circuit mutes the data going to the computer serial port while the local APRS radio is transmitting. This is necessary for enhancing the DF system accuracy and allow APRS to decay the transmit period.

Without this circuit, each time the local radio transmits APRS data, the DF radio hears the signal from the nearby transmitter.

This causes the DF unit to output false information to the computer. Also, APRS is now modified to decay the transmit period

from the DF if there is no data. Without this modification, when

the local APRS transmitter causes interference with the DF unit, the interface will output data to APRS and never allow the transmit period to decay.

#### CONNECTION TO THE INTERFACE BOARD

After building the DATA MUTE circuit, connect to the interface by following the steps below:

1. Cut or unsolder the ground lead of Q1 on the interface board.  
(It is the lead closest to the "Q1" ink on the board)  
Connect a wire from this lead to the 555 chip pin #3 on the interface board.
2. Connect 5VDC and Ground to the DATA MUTE board.
3. Tap off from your TNC's "PTT" line and connect it to the DATA MUTE board diode "D1".

NOTE: The value of C1 and R1 set the "hang time" of the circuit after the PTT line returns to "not transmitting" state. This

delay is necessary for the transmitter to stop, and the Doppler receiver to squelch. Increasing the value of either R1 or C1 will increase the hang time. If the circuit is built using the values provided in the schematic, the hang time should be sufficient for most radios.

#### BENCH TEST

Set the interface card for operation by it's instructions.  
(ie. Squelch open-LED 2 lights, squelch closed-LED 2 out)

Proper operation of this circuit will cause the data LED (LED 2) on the interface card to go out when the TNC is transmitting.

Open the squelch on the Doppler unit radio with the volume set normal DF setting. When the TNC PTT line goes low, the flow of data to the RS-232 port stops and LED 2 goes out. When the TNC releases the ground signal from the PTT line, there will be a delay (less

than 1 second) before LED 2 lights.

#### REAL TIME TEST

With all components of the DF station reconnected, and the TNC/radio combination ready, start APRS. Open the squelch on the

DF radio and LED 2 will illuminate. When the TNC keys the transmitter, LED 2 will go out and delay slightly beyond the transmit duration.

With everything operational, and no signal on the DF radio, APRS (version 6 or later) will start to decay the transmit interval.

When a signal is being DF'ed and the TNC transmits, interference may be heard on the DF speaker. No data will flow to the serial port during transmit. This prevents the interference from

skewing the data to APRS. It is important to note that NO DATA, skewed or otherwise, is going to APRS during TNC transmit.

#### OPTIONAL BAUD RATES

Changes were made in APRS that require optional baud rates for the N7LUE interface board. The optional rates allow several serial port units to share a single port provided they are all using the same baud rate. APRS originally required 2400 baud from the Doppler interface but recent changes have caused this change.

"GET OUT THE MAGNIFYING GLASS MILDRED, WE'RE DOING SURGERY!"

Four pins on the AY-5-8116T (U3) set the outgoing baud rate. These pins are 13,14,15,16. If you are familiar with binary counting, you will quickly see there are 16 baud rates to choose from. (50 thru 19,200 baud) As I originally designed the board, 2400 baud is "hardwired" to these pins. Here's how to change it:

Presently for 2400 baud pins 13-16 are tied as follows:  
13 hi, 14 lo, 15 hi, 16 lo, for 2400 baud.

To change to 4800 baud, cut traces and rewire as follows:  
13 hi, 14 hi, 15 lo, 16 lo, for 4800 baud.

To change to 1200 baud, cut traces and rewire as follows:  
13 lo, 14 hi, 15 hi, 16 hi, for 1200 baud.

To change to 9600 baud, cut traces and rewire as follows:  
13 hi, 14 hi, 15 hi, 16 lo, for 9600 baud.

That sounds great Larry, but now I have to consider is it worth it when  
no other software package besides APRS is causing any problems. I have  
four grounding rods right outside the wall of the shack, where everything  
is grounded. the closes antenna end on my dipole is 60 feet away. Will  
try a few things but like I say I really do not want to go head over  
heels for one software program.

Thanks for the info Larry it is very worthwhile. 73's

Brad

Message-ID: <Pine.SUN.3.91.950713011952.14188A-100000@greatlakes.nadn.navy.mil>  
Rendered body type: text/plain

Stan Horzepa's Packet Perspective in this months QST is all excited about the potential for meteor scatter via 2m packet. I was going to respond to him, but thought I would share it with the sig.

There is no better network on 2 meters than APRS for seeing meteor scatter, if it exists:

- 1) hundreds of stns nationwide are pinging on one freq, 145.79 24 hrs/day
- 2) 40% of the pings contain the stations exact POSIT
- 3) those same hundreds of stations are LISTENING 24 hours a day
- 4) EVERY SINGLE PACKET is being CAPTURED AND DISPLAYED
- 5) If a single packet gets a meteor bounce, then IT WILL BE KNOWN instantly to all who see it, not only by its LOCATION on the map but also its capture on the L-LIST, and its time of receipt on the HEARD page. Its path on the D-PAGE will show its UNPROTO path which will instantly tell you if it came terrestrially or was an UNIDENTIFIED-FLUKE-ON-PACKET (UFO-packet).

Now, that said, and my personal interest in M-scatter, I have ALWAYS kept an eye out for UFOs on APRS, convinced that it was the ideal mechanism for such a demonstration. I said all of this to aprssig, because I hope everyone else here realizes what a tremendous tool APRS is for capturing unusual propagation phenomenon.

BUT! in 4 years of monitoring, 24 hours a day, 365 days a year, I have only seen ONE meteor scatter packet. It was a K8 probably from OHIO. I got his BText, but not a posit (50/50 chance). It was 3 years ago (back when OHIO was about the only other APRS state on the air). IT was during a meteor SHOWER. After reading up on meteor scatter, I then found out how very poor 2m M.S. is even theoretically, with High power and BEAMS, and all of my experience to date re-enforces that.

There are a few things that could improve the chances, higher power and shorter packets. We probably dont want higher power on our APRS nets, but making our packets shorter is certainly possible. So keep your eyes open guys! With todays HF gateways popping up everywhere, it takes a little closer look to see how the pakekt got to you, but if it has GATE in its path, then HF is a sure bet.

STAN, if you do persue setting up an MS test on 2m, I would absolutely recommend APRS UI frames in the GridSquare mode. Total packet length:

WB4APR>CQMS: [FM19sx]

You all know of my wife's "love" for APRS. Yesterday I noticed that a thunderstorm had wiped out the WIDE that is smack in the middle of the East coast APRS backbone. Last night I was informed that it was alive and well, but on the INPUT of the 146.61 voice repeater! So I informed the wife of the 150 mile round trip to fix it. (Grumble) Now, I won't bore you with how a 3.5 hr job turned out to be 5.5 hrs, and how without a portable APRS with me, I couldn't wait to get home and see if it was back on the air. It wasn't. In fact, nothing was showing on my screen for the last 2 hours, exactly, about the time I left the site (the 2nd time)! As I was depressed and sullen, my wife took pity and treated me kindly. After a short chat she reminded me how she was getting tired of hearing those packets in the den... ARGH!!!! I raced into the den, and found the volume turned down! VOWALLA! In 10 minutes the net emerged, alive and well! During those 10 minutes we both read a little bit; her a mystery, and I, the NEW QST.. an article about how HI HI evolved from HEE HEE, which was from the old AMERICAN MORSE code for HO HO...

Anyway, the lights went out at 1 AM, bed time. A few minutes later, she asked in a pesky voice, WHAT are you doing???... My sheepish reply, Taping out Hi Hi, Hee Hee, Ho Ho on my chest... and scratching...?

Well, I have two hands, and I WAS curious how the difference in Hi, Hee and Ho sounded...

Maybe it's just late, but we BOTH got a laugh out of that one.. Boy we HAMS are really weird sometimes...

APR REPLY: Your dream come true. Contact PACCOMM, their Pico-TNC is about the size of a pack of cigarettes AND can be ordered with an INTERNAL GPS! AND with an INTERNAL RADIO! (tho im not sure if you can GET both in the same TNC at the same time)

## 196. Space mode is acting wierd!

From: fehner@cts.com (Barbara Fehner)  
Date: Thu, 13 Jul 95 01:12 PDT  
To: aprssig@tapr.org  
Message-ID: <m0sWJ08-0002FfC@kickme.cts.com>  
Rendered body type: text/plain

I have been practicing for the up-coming Space Shuttle test and have found some strange things.

1. The Space mode does not set the Grid-Square mode. I have to set Grid-Square mode first and then set Space mode to get the grid square in my position and beacon packets.

2. When a position packet is sent I get the "Congratulations" message although my transceiver is DISCONNECTED! Good for the ego but not so good for a QSL.

3. The Space mode does not set "OTHERpacket" mode although "Grid-Square" mode does.

4. When a beacon packet is sent the following message is displayed:  
NO> LINK STATE IS DISCONNECTED  
and no beacon packet is sent.

I am using APRS 7b and an AEA PK232MBX with a serial port rate of 9600 Baud. Can anyone figure out what is going on?

Thank's for any help.

Hi DE Sam,

Thanks for all the responses to my query for suggestions. I am looking at all and am open to any new ones you might have. This is a great group and I learn something everytime I read the mail.

Ryan Rucker, rtucker@worf.netins.net, asked concerning APRS:  
> Anybody working on a version for Linux? ;-)  
>

APRS 6.6 seemed to work fine in the DOS emulator of LINUX on my Pentium here at work. I have not checked it on the air though - however the mouse on the serial port was handled properly.

Now if I only got a working TNC here :-(

## 199. Meteor scatter 2

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>

Rendered body type: text/plain

OOPS, it was 2 AM when I sent that last msg. I had said that we need more power and shorter packets to make APRS an excellent MS meteor DX tool. I left out BEAMS!, and I was talking about the ROUTINE. Now, I agree with Stan, hows this for a suggestion for MS events:

- 1) During meteor showers, ALL APRS stations nationwide configure for MS.
  - a) Set GridSquare mode for short packets
  - b) set unproto path to NONE, zip, nada
  - c) GO to highest power
  - d) E coast BEAMS WEST, Wcoast beams EAST. N to S and S to N
  - e) Everyone transmit under computer control on the 15 sec period. N, S, E, then West or whatever is the standard.
- 2) I will program a special MS MODE which will do most of the above, Plus it will compare all incoming reports and plot them. It will ring bells and whistles when it sees posits beyond 400? miles...

Input I need from the experts to do this:

- a) Which region transmits on which 15 sec period?
- b) What is minimum range for the alarm lockout circle

CAVEATS: The success of this venture will be how well we can get ALL APRS stations nationwide to go into MS mode for the 12 hour periods (or whatever) of the major MS events. If each user of this SIG would send out a local BLTN as these events approached, then I would expect the word could get out pretty quickly.

NEW IDEA: This SIG needs an APRS.BK file which plots EVERYONE on this SIG!  
SEE NEXT MESSAGE!

---

## 200. SIG.bk BACKUP FILE!

From: Bob Bruninga <bruninga@greatlakes.nadn.navy.mil>  
Date: Thu, 13 Jul 1995 09:55:24 -0400 (EDT)  
To: aprssig@tapr.org

Rendered body type: text/plain

Keith? or anyone that knows how to write LISTSERVers, we need an automatic program that allows every member of this SIG to report his POSIT. The LISTSERV or automatic program would use these reports to BUILD an ONLINE SIG.BK file! Then, instantly, anyone on this sig could load it into APRS and see where everyone else is.

One immediate use of this, would be to see how much of the US is covered, and if there are any dead spots. This info would BE IDEAL IF WE COULD GET IT NOW DURING THIS APRS-SAREX DEMO!!!

Who ever writes this utility, just tell us the exact format for the message, and we will send them to the address you specify. If anyone can do this, let me/us know ASAP.

---

## 201. Re: [APRSSIG:2224] SIG.bk BACKUP FILE!

From: Keith Sproul <ksproul@hardees.rutgers.edu>  
Date: Thu, 13 Jul 95 10:34:44 EDT  
To: aprssig@tapr.org  
Message-ID: <CMM-RU.1.4.805646084.ksproul@hardees.rutgers.edu>  
Rendered body type: text/plain

To start of with lets do the following..

Have EVERYONE send a SHORT message with your POSIT info to ME,

!!!!!!!!!!!!!!!!!!!!  
!!!NOT THE SIG!!!  
!!!!!!!!!!!!!!!!!!!!

I will write code to handle this and then at the end of the weekend, I will compile it and send it out as a HST file or what ever is appropriate so we can see who is actually on the net.

In the meantime, there is some MUCH better work being done for using the Net to do this type of stuff WITHOUT using a list-server, and this is being worked on by us,

Keith Sproul

AGAIN!!! DO NOT SEND YOUR POSITS TO THE ENTIRE SIG..

SEND THEM TO ksproul@noc.rutgers.edu

Keith
